About Sencore

Sencore is an engineering leader in the development of high-quality signal transmission solutions for the broadcast, cable, satellite, IPTV, telecommunications, and professional audio/video markets. The company's world-class portfolio includes video delivery products, system monitoring and analysis solutions, and test and measurement equipment, all designed to support system interoperability and backed by best-in-class customer support. Sencore meets the rapidly changing needs of modern media by ensuring the efficient delivery of high-quality video from the source to the home. For more information, visit www.sencore.com.

Revision History

Date (MM/DD/YYYY)	Version	Description	Author
11/11/2014	1.0	Initial Release (2.2.0 software)	NDM
03/29/2014	1.1	Update for 2.3.0 Release	CDP
06/16/2015	1.2	Update for 2.3.3 Release	CDP
07/20/2015	1.3	Update for 2.4.0 Release	CDP
11/01/2015	1.4	Update for 2.5.0 Release	CDP
03/02/2016	1.5	Update for 3.0.0 Release	CDP
06/06/2016	1.6	Update for 3.1.0 Release	CDP
09/28/2016	1.7	Update for 3.2.0 Release	CDP
04/07/2017	1.8	Update for 3.3.0 Release	ACD
01/27/2020	1.9	Appending to S2X Module Specs	BCR
06/04/2020	1.10	Update for 4.2.2 Release	JDN
07/27/2020	1.11	Update for the 4.2.3 Release	RAG
09/02/2020	1.12	Updated screenshots from new GUI	RAG

01/18/2021	1.14	Update for 4.4.0 Release	RAG

Safety Instructions

- Read these instructions
- Keep these instructions
- Heed all warnings
- Follow all instructions
- Do not use this apparatus near water
- Do not install near any heat sources such as radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat
- Do not defeat the safety purpose of the polarized or grounding-type plug. A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wide blade or the third prong is provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
- Protect the power cord from being walked on or pinched particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.
- Only use attachments/accessories specified by the manufacturer.
- Unplug this apparatus during lightning storms or when unused for long periods of time.
- Refer all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power-supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
- Do not expose this apparatus to dripping or splashing and ensure that no objects filled with liquids, such as vases, are placed on the apparatus.
- To completely disconnect this apparatus from the AC Mains, disconnect the power supply cord plug from the AC receptacle.
- The mains plug of the power supply cord shall remain readily operable.
- **Damage Requiring Service:** Unplug this product from the wall outlet and refer servicing to qualified service personnel under the following conditions:
 - When the power-supply cord or plug is damaged.
 - If liquid has been spilled, or objects have fallen into the product.
 - If the product has been exposed to rain or water.
 - If the product does not operate normally by following the operating instructions. Adjust only those controls that are covered by the operating instructions as an improper adjustment of the controls may result in damage and will often require extensive work by a qualified technician to restore the product to its normal operation.
 - If the product has been dropped or damaged in any way.
 - The product exhibits a distinct change in performance.
- **Replacement Parts:** When replacement parts are required, be sure the service technician uses replacement parts specified by Sencore, or parts having the same operating characteristics as the original parts. Unauthorized part substitutions made may result in fire, electric shock or other hazards.

SAFETY PRECAUTIONS

There is always a danger present when using electronic equipment.

Unexpected high voltages can be present at unusual locations in defective equipment and signal distribution systems. Become familiar with the equipment that you are working with and observe the following safety precautions.

- Every precaution has been taken in the design of your AG 5800 to ensure that it is as safe as possible. However, safe operation depends on you the operator.
- Always be sure your equipment is in good working order. Ensure that all points of connection are secure to the chassis.
- Never work alone when working in hazardous conditions. Always have another person close by in case of an accident.
- Always refer to the manual for safe operation. If you have a question about the application or operation call Sencore for assistance.
- **WARNING** – To reduce the risk of fire or electrical shock never allow your equipment to be exposed to water, rain or high moisture environments. If exposed to a liquid, remove power safely (at the breaker) and send your equipment to be serviced by a qualified technician.
- To reduce the risk of shock the AG 5800 must be securely connected backplane in a frame that is connected to a mains socket outlet with a protective earthing connection.

CAUTION – Danger of explosion if battery is incorrectly replaced. Replace only with the same or equivalent type.

STATIC DISCHARGE

Throughout this chapter, please heed the following cautionary note:

ESD Susceptibility: *Static discharge can cause serious damage to sensitive semiconductor devices. Avoid handling circuit boards in high static environments such as carpeted areas, and when wearing synthetic fiber clothing. Always exercise proper grounding precautions when working on circuit boards and related equipment.*

FCC Class A Information

The AG 5800 has been tested and found to comply with the limits for a Class A digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his or her own expense.

Shielded cables must be used with this unit to ensure compliance with the Class A FCC limits.

FCC Class B Information

The CRD 1900 has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation.

If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

 *Warning: Changes or modifications to this unit not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.*

Dolby Digital Information

This product has been manufactured under license from Dolby Laboratories.

“Dolby Digital”, “AC-3”, and “Dolby Digital Plus” are licensed trademarks of Dolby Laboratories.

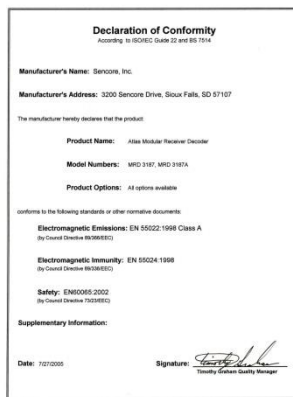

Package Contents

The following is a list of the items that are included along with the AG 5800:

1. Declaration of Conformity
2. Backplane
3. Quick Start Guide

Note: If any option cables were ordered with the AG 5800, they will be included in the box as well.

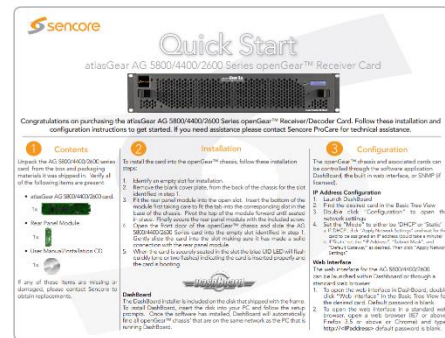

If any of these items were omitted from the packaging of the AG 5800 please call 1-800-SENCCORE to obtain a replacement. Manuals for Sencore products can be downloaded at www.sencore.com

Section 1 Overview

Introduction

This section includes the following topics:

1.1	Product Introduction.....	11
1.2	Cooling.....	11
1.3	Rack Information.....	11

1.1 Product Introduction

This user manual describes the operation of the AtlasGear AG 5800 openGear™ compatible card, which features an ASI input, MPEG2/H.264 decoder, dual redundant switchable HD-SDI and SD-SDI outputs, along with the following input interface options:

- 1) IP
- 2) DVB-S/S2

Other output signals include an ASI transport stream extracted from the active input and dual AES outputs.

Latest-generation components ensure that the AG 5800 provides the most complete feature set and the best value for a broad swath of common receiver/decoder applications. The product supports decoding of SD or HD video, encoded as either MPEG-2 or H.264, as well as up to four audio services.

The additional audio handling capability makes the AG 5800 the perfect solution for video distributors looking to meet upcoming descriptive video requirements, while continuing to support surround, stereo, and SAP services. The product also supports professional-grade downscaling at no additional charge for providers continuing to support legacy equipment or SD tiers. As customer demands evolve, units purchased for SD applications can be upgraded to HD output via a simple software license.

With built-in ASI input/output capability, as well as available satellite and IP interfaces, the AG 5800 is adaptable to most decoder use cases. The card also maintains Sencore's long tradition of ease of use, with a web interface accessible via all major browsers once an IP address is assigned to the card using the openGear™ DashBoard™, and is backed by Sencore's best-in-class ProCare support.

1.2 Cooling

The AG 5800 is cooled via forced induction through the front of the chassis and exhausted through the vents in the rear of the backplane. The AG 5800 is equipped with a temperature-controlled status indicator. If the external temperature of the card exceeds 50° C a temperature error will be triggered and the description of the error will appear in the "Error List."

1.3 Rack Information

The AG 5800 is intended to be mounted in a CRD 4900, CRD 1900 or AG-4800A/X/XS openGear™ frame (or equivalent). The card takes up two slots in the 20-slot chassis (10 card maximum).

Section 2 Getting Started

Introduction

This section includes the following topics:

2.1	Installation.....	13
2.2	Onboard Controls and LEDs.....	14
2.3	Backplate	15
2.4	Maintenance	15
2.5	Setting up the AG 5800 using DashBoard™	15
2.6	Set up the AG 5800 using the CRD 4900.....	19

2.1 Installation

Carefully unpack the AG 5800 card and inspect it for any signs of damage. Do not insert the card into the chassis if any damage is evident, and if so, please contact Sencore.

The AG 5800 occupies two slots in the chassis, allowing up to 10 cards to be inserted into the frame.

Fit the rear panel PCB supplied with the AG 5800 card at the selected slot location, removing the blanking plate if necessary. The rear panel PCB is fixed to the rear panel of the chassis using a single screw. **Error! Reference source not found.** shows the chassis mounting system.

Figure 1: Chassis mounting system

Open the chassis front panel and slide the AG 5800 card carefully into place. As the card slips home, the removal lever at the bottom front edge of the card will move to its fully upright position. This lever can be used to remove the card easily if required.

The chassis can be operated with the front panel open; however, if enough cards are fitted the warning buzzer will sound, indicating that the chassis is beginning to overheat. Operating the chassis while the warning buzzer is sounding is not advised and may cause damage to the cards. The warning buzzer can be cancelled by pressing the small button at the front edge of the chassis controller card. The chassis incorporates powerful cooling fans in the front panel, and for normal operation the front panel should be closed to ensure adequate cooling, and the vent slots free from obstruction.

More information about the chassis can be found in the AG-4800A, AG 4800X/XS, CRD 4900 chassis manuals. The CRD 1900 chassis information can be found in [Appendix G](#).

2.2 Onboard Controls and LEDs

The AG 5800 decoder card uses a combination of button controls and LED's to reboot/recover the card and provide local status information. *Figure 2* shows these controls and LEDs, and they are also briefly described in this section.

Figure 2: View of card edge controls and LEDs

Button Controls

There are two button controls available on the AG 5800:

- **Boot to Recovery Image:** If the card becomes corrupted, the user can remove the card from the slot and then reinsert the card while pressing and holding this button to boot to the recovery image. The user must hold the button down until the blue LED (UID) light quits flashing (about 10 seconds). Once in the recovery image, the user can push new software to the card.
- **Card Reset:** The user can press this button to reset the card.

Status LEDs

Three LEDs are located on the front edge of the board:

- **Unit Identification (UID) LED:** The user can enable this LED to easily identify a specific card. When enabled, this LED (along with one on that back of the card that can be seen through a hole in the backplane) will light up blue.
- **Input Presence LED:** This illuminates green when receiving a transport stream on the active input.

- **Active Error LED:** This illuminates red whenever an error is currently active on the AG 5800.

2.3 Backplate

Each AG 5800 card comes paired with a compatible backplate. Figure 3 shows the backplate for an AG 5800 card with the DVB-S2 input option.

Figure 3: Backplate with DVB-S2 Input Option

2.4 Maintenance

The AG 5800 is virtually a maintenance-free piece of equipment. There are no user serviceable parts on the card.

2.5 Setting up the AG 5800 using DashBoard™

This section provides step-by-step operating instructions for configuring the IP address of the AG 5800 card using the DashBoard™ remote user interface. Once an IP address is assigned the card can be controlled through the Web GUI.

Installing DashBoard™

To install the DashBoard™ user interface software, use the following steps:

1. Insert the included CD into a computer and launch the installer file.
- or
1. Visit <https://www.opengear.tv/control-monitoring/dashboard-control-system/> to download the DashBoard™ setup file.
2. Click on the Dashboard installation link that matches your operating system (Windows, OSX, or Linux). There will be a number of license agreements to accept, then the suggested installation location and start folder name will be displayed. It is recommended that the suggested locations and folder names

are accepted. It is required that a network connection is present to allow remote control of the openGear™ frame(s).

After installation, DashBoard™ will start automatically. There is no requirement to restart your PC.

DashBoard™ screen layout overview

Error! Reference source not found. shows the startup DashBoard™ screen. DashBoard™ has discovered an accessible frame. Note the “Sencore 4800A Frame1” icon near the top of the Basic Tree View pane.

Clicking on the triangle (▶) symbol next to the frame name will display the available cards in the frame.

Figure 4: Dashboard™ opening window view

Figure 5: Available cards window view

Error! Reference source not found. shows that the Master Frame Controller (MFC) card, and the Sencore AG 5800 card are available in slots 0 and 3, and are currently showing no alarms. Hovering the mouse pointer over each LED icon will give a tooltip style summary of status.

Clicking on the triangle (▶) symbol next to the AG 5800 card will display the “Configuration” and “Web Interface” selections for that card (see **Error! Reference source not found.**).

Figure 6: Configuration and Web Interface in Basic Tree View

Network setup using DashBoard™

Double clicking “Configuration” will launch the setting and status window panes for the AG 5800 card shown in **Error! Reference source not found.**

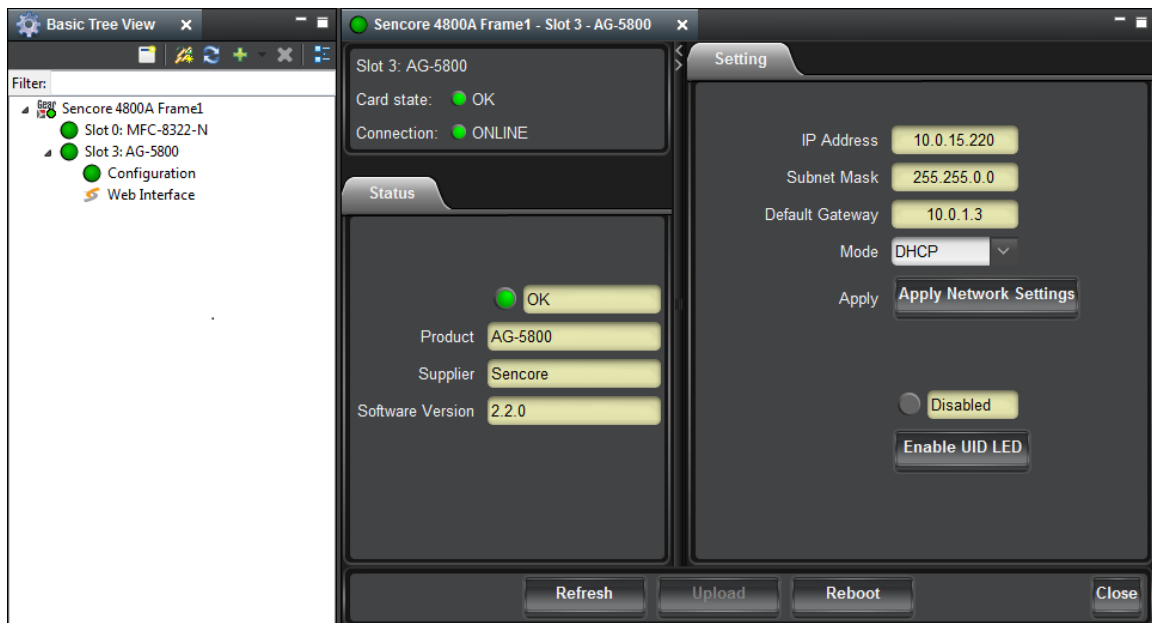

Figure 7: Configuration

In the setting pane, the user can view the following network configuration settings:

- 1) IP Address
- 2) Subnet Mask
- 3) Default Gateway
- 4) Mode

The AG 5800 card can be assigned either assigned an IP address either manually, or by DHCP (card will be set to DHCP by default).

Follow the following steps to provide a static IP address to the card:

- 1) In the setting pane, change 'Mode' to "Static".
- 2) Set the 'IP Address', 'Subnet Mask', and 'Default Gateway' to the desired settings.
- 3) Click 'Apply Network Settings'.

Follow the following steps to obtain an IP address using DHCP:

- 1) In the setting pane, change 'Mode' to "DHCP".
- 2) Click 'Apply Network Setting'.

Note: It may take up to a minute for the AG 5800 to obtain an IP address.

2.6 Set up the AG 5800 using the CRD 4900

This section provides step-by-step operating instructions for configuring the IP address of the AG 5800 card using the CRD 4900 remote user interface. Once an IP address is assigned the card can be controlled through the Web GUI.

CRD 4900 screen layout overview

Figure 8 shows the CRD 4900 main screen. The CRD 4900 has discovered accessible cards. Note the "AGXXXXX" cards listed in Figure 9. There are also buttons on the menu for each AG card installed in the chassis. At the top there are different panels that can be accessed including Main, Admin, Reporting and About.

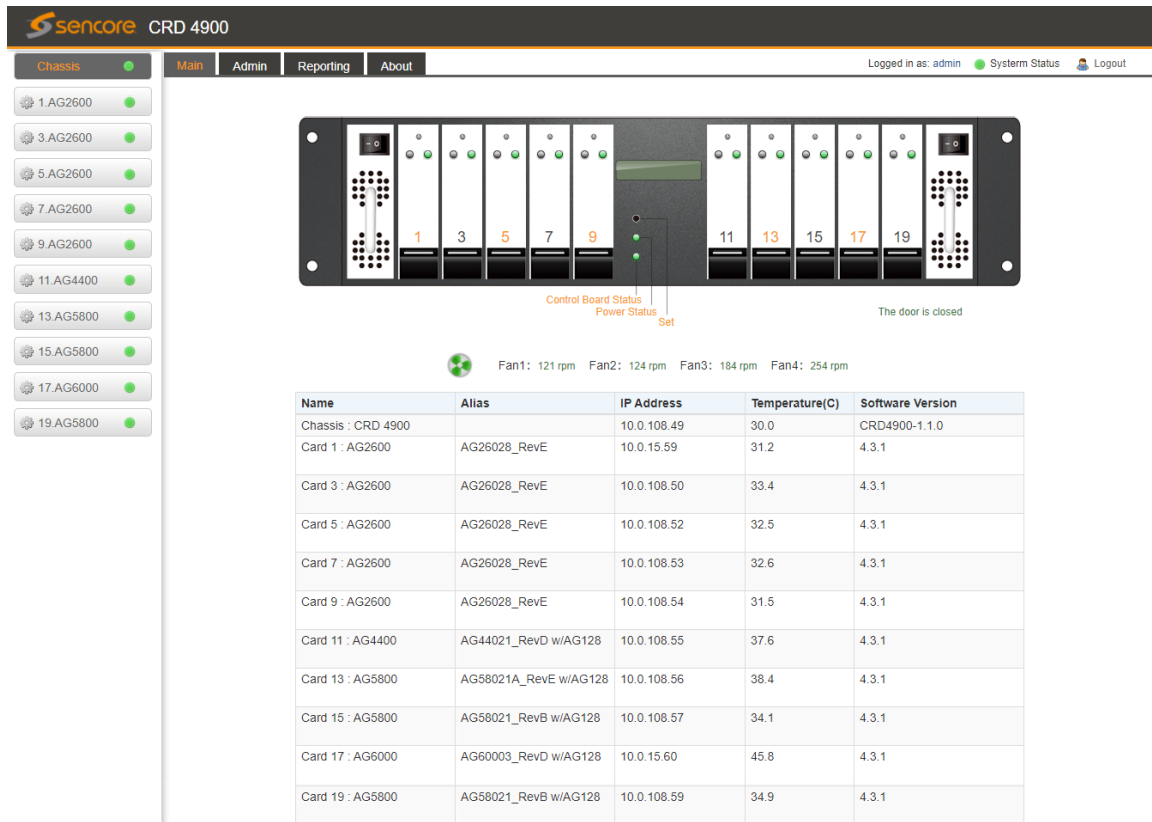

Figure 8: CRD 4900 main screen

Name	Alias	IP Address	Temperature(C)	Software Version
Chassis : CRD 4900		10.0.108.49	30.0	CRD4900-1.1.0
Card 1 : AG2600	AG26028_RevE	10.0.15.59	31.2	4.3.1
Card 3 : AG2600	AG26028_RevE	10.0.108.50	33.4	4.3.1
Card 5 : AG2600	AG26028_RevE	10.0.108.52	32.5	4.3.1
Card 7 : AG2600	AG26028_RevE	10.0.108.53	32.6	4.3.1
Card 9 : AG2600	AG26028_RevE	10.0.108.54	31.5	4.3.1
Card 11 : AG4400	AG44021_RevD w/AG128	10.0.108.55	37.6	4.3.1
Card 13 : AG5800	AG58021A_RevE w/AG128	10.0.108.56	38.4	4.3.1
Card 15 : AG5800	AG58021_RevB w/AG128	10.0.108.57	34.1	4.3.1
Card 17 : AG6000	AG60003_RevD w/AG128	10.0.15.60	45.8	4.3.1
Card 19 : AG5800	AG58021_RevB w/AG128	10.0.108.59	34.9	4.3.1

Figure 9: Available card window view

Network setup using DashBoard™

Clicking on the settings cog next to an AG card will launch the Configure IP window for the AG 5800 card shown in Figure 10.

The image shows a 'Configure' window with the following fields and values:

Field	Value
Mode:	DHCP
IP Address:	10.0.15.59
Subnet:	255.255.0.0
Gateway:	10.0.1.3
UID Status:	<input checked="" type="radio"/> Enable UID

Buttons: Apply, Cancel

Figure 10: Configure IP window

In the setting pane, the user can view the following network configuration settings:

- 1) Mode
- 2) IP Address
- 3) Subnet
- 4) Gateway
- 5) UID Status

The AG 5800 card can be assigned either assigned an IP address either manually, or by DHCP (card will be set to DHCP by default).

Follow the following steps to provide a static IP address to the card:

- 1) In the setting pane, change 'Mode' to "Static".
- 4) Set the 'IP Address', 'Subnet Mask', and 'Gateway' to the desired settings.
- 5) Click 'Apply'.

Follow the following steps to obtain an IP address using DHCP:

- 10 In the setting pane, change 'Mode' to "DHCP".
- 11 Click 'Apply'.

Note: It may take up to a minute for the AG 5800 to obtain an IP address.

Section 3 Operating the Web Interface

Introduction

This section includes the following topics:

3.1	AG 5800 Web Interface Overview	23
3.2	Main Panel	25
3.3	Admin Panel	75
3.4	Reporting Panel	90
3.5	About Panel	94

3.1 AG 5800 Web Interface Overview

3.1.1 Logging into the AG 5800 Web Interface

Once an IP address is set, each of the cards can be independently controlled via the web interface. To open the AG 5800 web interface, use one of the following supported browsers and navigate to the card's IP address:

- Internet Explorer 7 & above
- Firefox 3.5 & above
- Google Chrome

The web interface can also be launched within DashBoard™ by double-clicking “Web Interface” in the basic tree view of DashBoard™.

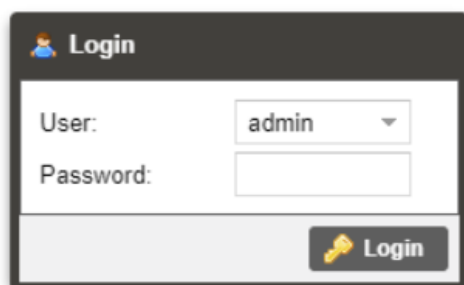

The web interface can also be launched in the CRD 4900 Web GUI by clicking on the desired AG XXXX button on the left side menu.

The user will need to login to the web interface. Press the login button in order to login to the web interface.

Default Credentials

Username: admin

Password: mpeg101

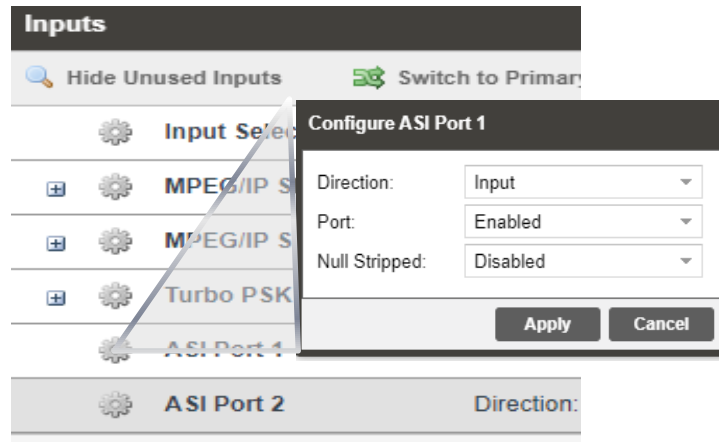

3.1.2 Hiding Unused Inputs

The AG 5800 web interface allows the user to hide inactive inputs using the  button or show all available inputs by click the  button. Only the inputs configured as the Primary Input and Backup Input (see Section 3.2.1) will be displayed when unused inputs are hidden.

3.1.3 Buttons and Status Indicators

When the  icon is shown, user configuration is available. Clicking this button will open menus where settings can be changed by the user.

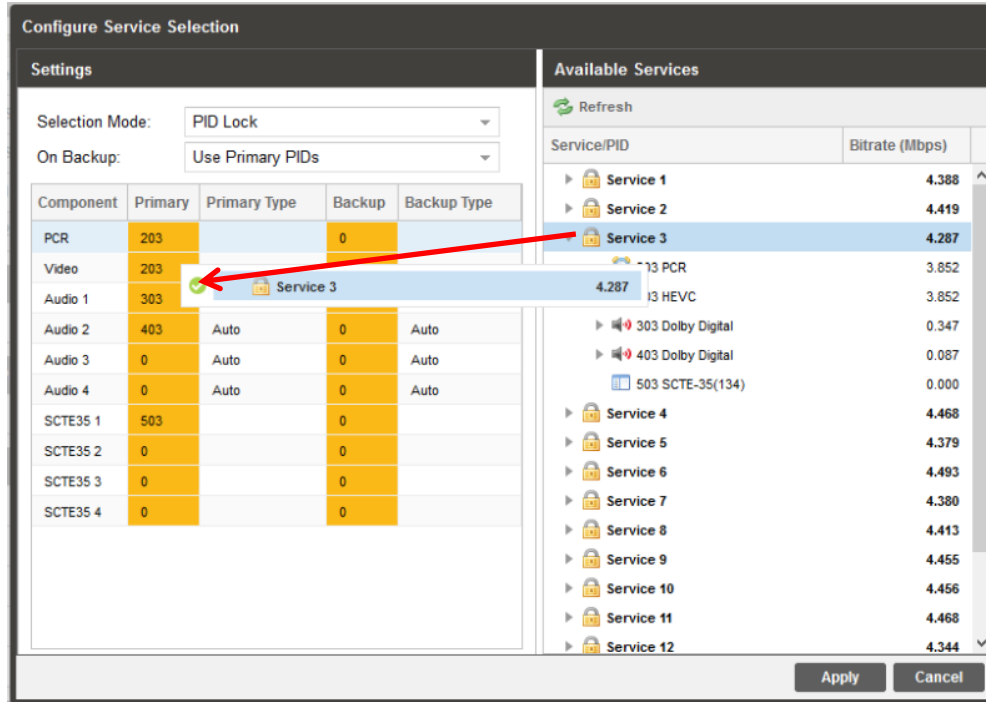

When the  icon is shown additional status information can be viewed. Click this button will expand the menu to display the additional status information. All text in status menu shown in **ORANGE** are user configurable settings. Text shown in **BLUE** is not user configurable and is strictly a status or value. To minimize the status windows again click the  icon.

Status in the AG 5800 web interface is shown with LED status indicators:

Green LED		Status is good. No errors are present and function is operating normally.
Red LED		Status indicates function is affected by active error. To view the errors, navigate to Alarms panel to view Active Errors.
Grey LED		Status is inactive. Function is currently disabled or unavailable.

3.1.4 Drag and Drop Menus

Certain menus in the AG 5800 allow the user to drag and drop items to auto populate fields. Conditional Access and Service Selection menus are some examples of menus that drag and drop can be used. In the example below a service in the transport stream view on the right-hand side of the window is selected and dragged over to auto populate the PIDs in the service selection section.

3.2 Main Panel

The Main panel of the AG 5800 web interface is used to configure the unit to decode, de-encapsulate and demodulate. When configuring the AG 5800 the user begins at the top of the menu and works down. The inputs are configured, then descrambling (if present), then service or PIDs are selected for decode, then outputs are configured. Figure 11 below is a card equipped with the DVB-S/S2 input option, CAM module, and all applicable options licensed.

The screenshot displays the Main Control Panel of the AG 5800 interface. At the top, there are navigation tabs: Main, Admin, Reporting, and About. Below these is the 'Main Control Panel' header. The interface is divided into several sections:

- Inputs:** This section includes a 'Show Unused Inputs' button, a 'Switch to Backup Input' button, and a 'View PSI Tables' button. It contains a table with input details:

Input Selection	Active: MPEG/IP Stream 1	Primary: MPEG/IP Stream 1	Backup: MPEG/IP Stream 2
MPEG/IP Stream 1	239.100.100.139:9021	Packet Status: Present	FEC: Not Present
MPEG/IP Stream 2	239.100.30.139:9021	Packet Status: Present	FEC: Not Present
- Decoding:** This section shows decoding parameters:

Service	Service: 3 (WBTS-CD)	Mode: Auto Seek
Video	PID: 49 (MPEG-2 MP@HL 4:2:0 8 Bit)	Native Format: 1920x1080i 16x9 29.97fps
Audio 1	PID: 52 (Dolby Digital)	Format: 384 kbps 48.0 kHz 3/2
Audio 2	PID: 53 (Dolby Digital)	Format: 96 kbps 48.0 kHz 2/0
- Baseband Processing:** This section shows baseband processing parameters:

Video	Format Mode: Auto	Output Format: 1920x1080i 16x9 29.97fps
Audio	External Format: None	Ref. Source: Disabled
Genlock	Color Reference: Not Present	
- Baseband Outputs:** This section shows baseband output options:

SDI Port 1 & 2
Digital Audio
- Data Outputs:** This section includes a 'Show Unused Outputs' button.

Figure 11: Main Panel

3.2.1 Configuring Active Inputs

This menu allows the user to configure a primary and backup input. In case there is an input failover the AG 5800 is capable of detecting the failed state and switching to a secondary backup input in order to provide a continuous output. Which input is primary and backup, how the inputs switchover and restore and switchover timing is all user-configurable. The user can force the AG 5800 to switch between the

Primary and Backup Inputs by clicking the  **Switch to** button. To change the active input and failover settings click the  icon next to Input Selection as shown in Figure 12 and Figure 13 below.

Inputs				
Hide Unused Inputs		Switch to Backup Input		
Input Selection	Active: ASI	Primary: ASI	Backup: MPEG/IP Stre	
MPEG/IP Stream 1	239.192.108.70:10070	Packet Status: Not Present	FEC: Not Present	
MPEG/IP Stream 2	239.192.0.201:10000	Packet Status: Not Present	FEC: Not Present	
ASI	Null Stripped: Disabled

Figure 13: Active Input and Failover Configuration Menu

Setting	Range	Description
Primary Input	ASI	Used for both normal operation and input failover settings. During normal operation this input will be the active input.
	MPEG/IP Stream X	
	8VSB/QAM Slot X	
	DVB-S2 Port X	
	DVB-T2/C2/ISDB-T Slot X	
	None	
Backup Input	ASI	During failover operation this input will become the active input. The catalyst for what causes the unit to switch to this input is configured in the following setting.
	MPEG/IP Stream X	
	8VSB/QAM Slot X	
	DVB-S2 Port X	
	DVB-T2/C2/ISDB-T Slot X	
	None	

Switch On	Manual Only	<i>Manual Only:</i> the unit will not switch inputs automatically. The user must manually switch inputs.
	TS Sync Loss	<i>TS Sync Loss:</i> the AG 5800 will switch from the primary to the backup input if the primary stream loses synchronization for the duration of the Switchover Interval.
	Decode Failure	<i>Decode Failure:</i> the unit will switch to the backup input when it encounters decoding errors on the primary input.
Restore On	Manual Only	<i>Manual Only:</i> the unit will not restore to the primary input automatically. The user must manually switch inputs.
	Primary Input TS Restored	<i>Primary Input TS Restored:</i> the AG 5800 restores to primary when the Primary input regains transport stream synchronization.
	Backup Input TS Sync Loss	<i>Backup Input TS Sync Loss:</i> the unit will switch from backup to primary when the backup stream loses synchronization for the duration of the Switchover interval.
	Decode Failure	<i>Decode Failure:</i> the unit restores to the Primary Input when the Backup Input experiences a decoding error.
Switchover	1-20 seconds	The time in seconds which <i>Switch On</i> or <i>Restore On</i> value must remain in the configured state before the AG 5800 switches between the Primary Input and Backup Input or vice versa.

3.2.2 Configuring ASI Input

This menu allows the user to either Enable or Disable the ASI Input on the AG 5800 as well as set the Null Stripped setting, as shown in Figure 14. No other configuration is necessary for the ASI Input.

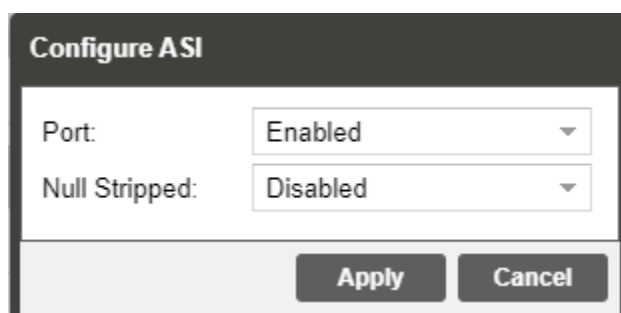

Figure 14: ASI Input Configuration Menu

Setting	Range	Description
Port	Enabled Disabled	This setting allows the user to enable or disable the ASI Input to the AG 5800.
Null Stripped	Disabled Enabled	Enabling Null Stripped allows the AG 5800 to receive streams that do not contain null packets. (i.e., VBR Transport Streams)

3.2.3 Configuring MPEG/IP Input

If the card is equipped with the MPEG/IP option, the following menus and options shown in Figure 15 will be available for configuration. This menu allows the user to configure the MPEG/IP inputs. Each MPEG/IP card has two ports that can be set to receive and/or transmit. This menu is for setting up the reception of MPEG/IP unicast or multicast transport streams. The menu for Stream 1 and 2 has the same settings. IGMPv2 is used to join/leave multicast streams by default if no IGMP Filter addresses are entered. If IGMP Filter Mode addresses are specified then IGMPv3 is used.

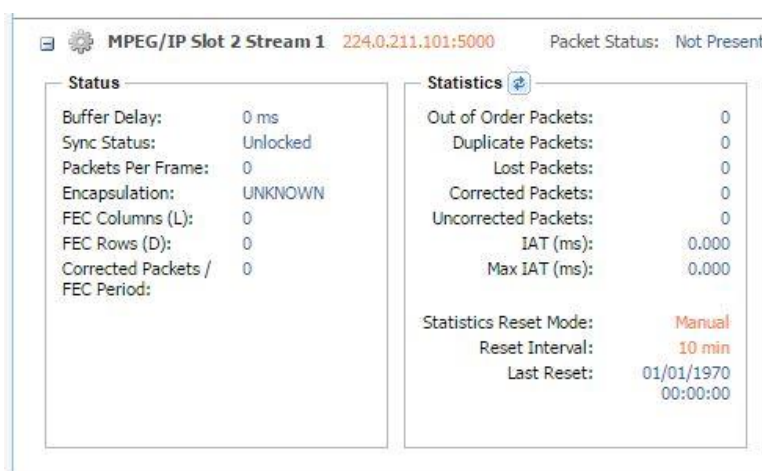

Figure 15: MPEG/IP Input Configuration Menu

Setting	Range	Description
Receive	Enabled Disabled	This setting allows the user to enable or disable these input stream settings.
Physical Connector	Port 1 Port 2 Port 1 (Card) Port 2 (Chassis)	The physical connector on the AG 127 MPEG/IP card that will be used to receive the input. The physical connector on the AG 128 MPEG/IP card that will be used to receive the input.
Mode	Multicast Unicast	<i>Multicast</i> setting allows the unit to receive multicast streams. Multicast streams originate from the IP range 224.0.0.0 – 239.255.255.255. <i>Unicast</i> allows the unit to

		receive unicast streams. Unicast streams originate directly from a source device.
Destination IP	224.0.0.0 – 239.255.255.255	This setting is only available when receiving a multicast stream. This address is the IP address the source device is sending to.
Destination Port	0 - 65535	This is the UDP port the source device is sending to. This is the only setting required to receive a unicast stream.
FEC	Enabled Disabled	Enabling FEC (Forward Error Correction) tells the AG 5800 to look at Destination Port +2 and Destination Port +4 for a SMPTE 2022 FEC Matrix.
Internal Source Filter	Enabled Disabled	Enabling Source filtering disables IGMP V3 filtering and allows a user to whitelist a single IP address for a given multicast and block all other source IP's
Internal Source Filter IP	0.0.0.0 – 255.255.255.255	Source IP for whitelist. All other source IP addresses are blocked
IGMP Filter Mode	Exclude Include	Used on networks supporting IGMPv3. If this setting is set to <i>Exclude</i> any streams originating from the user defined IP addresses will be rejected. If this setting is set to <i>Include</i> any streams originating from the user defined IP addresses will be received.
Null Stripped	Enabled Disabled	Enabling Null Stripped allows the AG 5800 to receive streams that do not contain null packets. (i.e., VBR TS Streams)
RTP SSRC	Enabled Disabled	Enabling RTP SSRC allows the AG 5800 to filter the input by the user defined value. Only streams containing the user defined value will be received by the AG 5800.
SSRC Filter Value	0 - 4294967295	The Filter Value the AG 5800 checks for before receiving a stream with RTP SSRC.
Buffer Mode	Size (KB) Delay (ms)	Allows option to set buffer mode to Size in KB or Delay ms
Buffer Size (KB)	1 – 4000 KB	This setting determines how much data is received before the AG 5800 starts decoding. Increasing this value will allow the AG 5800 is receive streams on networks with high network jitter. Increasing this value also increases the latency of the AG 5800.
Buffer Delay (ms)	1 – 4000 ms	The buffer delay setting allows the buffer size to be set by delay time. The Buffer

delay time will be determined by the input data rate.

Statistics Reset Mode	Manual	Statistics can be viewed by hitting the + symbol next to the MPEG/IP option card on the main window. Selecting Auto will reset the statistics on a chosen interval. When the reset occurs, statistical information for that period will be logged. Selecting Manual will only clear the statistics by hitting the refresh button.
	Auto	
Reset Interval (min)	5-65535	Interval in which the Auto option will reset and log the statistics displayed on the main window

IP statistics menu

3.2.4 Configuring DVB-S/S2/S2X Input

If the DVB-S/S2/S2X input card was selected as a factory installed option, the following menus and options will be available for configuration. This menu allows the user to configure the DVB-S/S2/S2X inputs. The input card is equipped with dual demodulators and four ports (labeled A, B, C and D). This configuration allows the card to receive two signals simultaneously for fast switching between primary and backup inputs. The menu for both demodulators have the same settings. The input card will automatically detect modulation and symbol rate during signal acquisition. LNB Power configuration for this input card is configured in the DVB-S/S2/S2X menu.

Configure DVB-S2X Slot 1 Stream 1

	Physical ...	LNB Power	22 kHz Tone
	Port A	Off	--
	Port B	Off	--
	Port C	Off	--
	Port D	Off	--

Configuration of DVB-S2X

Setting	Range	Description
Receive	Enabled Disabled	This setting allows the user to enable or disable this input stream.
Physical Connector	Port A Port B Port C Port D	This setting allows the user to select which physical RF connector will be used to receive the stream.
Satellite Frequency	C-Band: 4GHz – 8GHz Ku Band: 11.2Ghz – 14.5Ghz L-Band: 950MHz – 2150MHz Dependent on LO Offset	If LO Offset is set to 0 then L-Band frequency is entered into the Satellite Frequency dialog box. If LO Offset to set to a pre-defined option then enter C-band or Ku-Band frequency.
Symbol Rate Mode	Auto Manual	This setting allows user to select if the satellite tuner automatically searches and determines the received signal symbol rate

		or if it is entered manually in the space below
Symbol Rate (Mps)	0.5 to 60	If Symbol Rate Mode is set to Manual then enter the satellite receive signal symbol rate
Manual Search Range	Enabled Disabled	This setting determines the satellite receiver automatic fine tuning (AFT) search range. Disabled by default – permits the receiver to auto tune or AFT range (+/- 20 MHz). Enabled allows the user to enter a manual range limiting or expanding the AFT search range
Search Range (MHz)	.5 – 70 MHz	If the Manual Search Range is set to Enabled then enter a MHz value for an AFT search range. The entered value includes a positive and negative search total range. For example: 10 MHz enables a +/- 5 MHz search range.
LO Offset	5150 9750 10600 10750 11250	The offset in MHz that the local oscillator is operating. Set to the LO frequency when you want to enter the Satellite transponder frequency in the Satellite Frequency field. Set to 0.0 when you want to enter the L-Band frequency in the Satellite Frequency field. <i>Note that this setting and the Satellite Frequency setting determine the L-Band frequency input to the receiver.</i>
PL Scrambling Code	0 – 262141	The AG has the ability to receive satellite signals scrambled using PL Scrambling. In order to receive the stream, enter the value of the incoming signals PL Scrambling code.
ISI	Enter input stream identifier (ISI)	Enter unique ID of the stream you want to receive within the DVB-S2/S2X satellite multi-stream (Advanced AG 58916 licensed feature)
LNB Power	Off 13 VDC 18 VDC	The AG 5800 has the ability to provide the necessary voltage to power an LNB. Select the correct voltage to supply to the LNB. Note: Due to power requirements, the AG4800A supports up to 7 AG 5800 cards per chassis when enabling LNB power.
22 kHz Tone	Enabled Disabled	Enabling or disabling the 22khz tone allows the AG 5800 to trigger the LNB to switch polarities.

3.2.5 Configuring DVB-S/S2 Input

If the card is equipped with the DVB-S/S2 Input option, the following menus and options shown in Figure 16 will be available for configuration. This menu allows the user to configure the DVB-S/S2 inputs. The DVB-S/S2 input option has two ports (labeled A and B) which only one port can be active at a time. This menu is for setting up the reception of DVB-S/S2 satellite signals. The menu for Port A and B has the same settings.

Configure DVB-S2 Port A	
Port:	Enabled
Mode:	Auto
Satellite Frequency (MHz):	950
Wide Search:	Disabled
LO Offset (MHz):	0.0
Symbol Rate Mode:	Manual
Symbol Rate (MSps):	1
PL Scrambling Code:	0
LNB Power:	Off
22kHz Tone:	Disabled
Multistream State:	Disabled
ISI:	0
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

Figure 16: DVB-S2 Configuration Men

Setting	Range	Description
Port	Enabled	This setting allows the user to enable or disable this reception port.
	Disabled	
Mode	DVB-S	This setting allows the user to choose between <i>DVB-S</i> or <i>DVB-S2</i> modulation schemes. Setting to Auto will have the unit automatically detect whether the input is DVB-S or DVB-S2.
	DVB-S2	
	Auto	

Satellite Frequency	C-Band: 4GHz – 8GHz Ku Band: 11.2Ghz – 14.5Ghz L-Band: 950MHz – 2150MHz Dependent on LO Offset	If LO Offset is set to 0 then L-Band frequency is entered into the Satellite Frequency dialog box. If LO Offset to set to a pre-defined option then enter C-band or Ku-Band frequency.
Wide Search	Enable Disable	When Enabled the search range may be extended depending on the symbol rate. See appendix C for more information.
LO Offset	5150 9750 10600 10750 11250	The offset in MHz that the local oscillator is operating.
Symbol Rate Mode	Manual Auto	The Manual option allows the user to choose the symbol rate. The Auto option automatically detects the incoming symbol rate. Note: Acquisition time may be longer in auto mode, especially when the symbol rate is below 1MSps or above 55MSps.
Symbol Rate	0 - 60	The symbol rate of incoming satellite signal in MSps. Accurate to one decimal place (kSps). Used when Symbol Rate Mode is set to Manual.
PL Scrambling Code	0 – 262141	The AG 5800 has the ability to receive satellite signals scrambled using PL Scrambling. In order to receive the stream, enter the value of the incoming signals PL Scrambling code.
LNB Power	Off 13 VDC 14 VDC 18 VDC 19 VDC	The AG 5800 has the ability to provide the necessary voltage to power an LNB. Select the correct voltage to supply to the LNB. Note: Due to power requirements, the AG4800A supports up to 7 AG 5800 cards per chassis when enabling LNB power.
22 kHz Tone	Enabled Disabled	Enabling or disabling the 22khz tone allows the AG 5800 to trigger the LNB to switch polarities.
Multistream State	Enabled Disabled	The AG 5800 has the ability to receive multistream satellite signals. If the signal is multistream capable, enable this setting.

This option is only available in DVB-S2 Mode.

NOTE: This is a licensed feature.

ISI

0-255

This setting is the ISI (Input Stream Identifier) the AG 5800 uses to filter multistream input. This option is only available if Multistream is licensed and enabled.

3.2.6 Configuring 8VSB/QAM Input

If the 8VSB/QAM Input card was selected as a factory installed option, the following menus and options will be available for configuration. This menu allows the user to configure the 8VSB/QAM input. This menu is for setting up the reception of 8VSB off air signals or QAM cable signals.

Configure 8VSB/QAM Slot 1 Port A

Receive:	Enabled
Mode:	8VSB
Channel Plan:	Off Air
Channel:	2
Low RF Level (dBmV):	-10
Low MER (dB):	20

Apply Cancel

Setting	Range	Description
Receive	Enabled Disabled	This setting allows the user to enable or disable this reception port.
Mode	8VSB 64-QAMB 256-QAMB	This setting allows the user to choose between 8VSB or QAM modulation schemes.
Channel Plan	Off Air FCC Cable HRC Cable IRC Cable	If 8 VSB is the selected Mode, the only available option is <i>Off Air</i> . If either 64-QAMB or 256-QAMB is the selected Mode, this setting allows the user to choose which Cable scheme is used.

Channel	Off Air: 2-69 FCC, HRC, or IRC Cable: 2-158	This setting is for the desired channel to be received.
Low RF Level (dBmV)	-34 - +40	This is the Low RF Level threshold when the <i>Low Level</i> Alarm will be triggered in dBmV
Low MER (dB)	0 - 40	This is the Low MER threshold when the <i>Low MER</i> Alarm will be triggered in dB.

3.2.7 Configuring DVB-T2/C2/ISDB-T Input

If the DVB-T2/C2/ISDB-T Input card was selected as a factory installed option, the following menus and options will be available for configuration. This menu allows the user to configure a DVB-T/T2/C/C2 or ISDB-T input.

Configure DVB-T2/C2/ISDB-T Slot 1

General

Mode	DVB-T DVB-T2 DVB-C DVB-C2 ISDB-T	This setting allows the user to choose between <i>DVB-T/T2/C/C2</i> or <i>ISDB-T</i> modulation schemes.
Channel Plan	Australia Eur-Asia-Afr Ireland New Zealand Taiwan South Africa South America United Kingdom European Cable Japan Philippines	This setting allows the user to select which channel plan they would like to use. Channel Plan options are tied to which modulation mode is selected.
Channel		Select a channel from the channels available in the dropdown. The list of available channels will be based on which channel plan is selected
Frequency (MHz)	42-1002	Selecting a channel from the channel dropdown will populate this field automatically based on the user selected channel. A user can manually select a frequency if desired
Bandwidth	1.7 MHz 5 MHz 6 MHz 7 MHz 8 MHz	Selecting a channel from the channel dropdown will populate this field automatically based on the user selected channel plan. A user can manually select channel bandwidth if desired.
PLP ID		Unique PLP ID used to select a particular stream within the DVB-T2 or DVB-C2 input signal
Profile	Auto Base Lite	Select the DVB-T2 profile to use

Low RF Level (dBmV)	-34 - +40	This is the Low RF Level threshold when the <i>Low Level</i> Alarm will be triggered in dBmV
Low MER (dB)	0 - 40	This is the Low MER threshold when the <i>Low MER</i> Alarm will be triggered in dB.

3.2.8 Configuring DVB-CI Descrambling

This section will describe how to configure DVB-CI descrambling in the AG 5800 (if equipped). First, the user will need to configure the CAM and descrambling mode. Once this is complete the user can configure which services or PIDs to descramble if licensed for multiservice descrambling.

3.2.8.1 Configuring DVB-CI module

This menu allows the user configure the DVB-CI module in the AG 5800 as shown in Figure 17. The AG 5800 has one DVB-CI slot where a CAM Module can be inserted. The CAM Module can be reset manually using the  button. The  button opens the MMI (Man Machine Interface) for the CAM. MMI support is dependent on what is supported by the CAM.

Figure 17: DVB-CI Configuration Menu

Setting	Range	Description
Mode	Descramble Decoded PIDs Descramble Selected PIDs Descramble Selected Services	<i>Decoded PIDs</i> sets the AG 5800 to descramble only the PIDs of the service that is currently set to decode (this is the only mode available if not licensed for multiservice descrambling). If the PIDs change in the incoming stream the AG 5800 will adapt to these changes, provided that Service Selection is set to "Service Lock" (Refer to Section 3.2.10). <i>Selected PIDs</i> sets to the AG 5800 to descramble PIDs set in the Descramble Services window (Refer to Section 0). If the PIDs change in the

		incoming stream the AG 5800 will not adapt to these changes and will not be able to descramble. Selected Services sets the AG 5800 to descramble Services set in the Descramble Services window (Refer to Section 0). If the Services change in the incoming stream the AG 5800 will not be able to descramble.
Single Slot	Enabled	This setting allows the user to enable or disable the DVB-CI module.
	Disabled	

3.2.8.2 Configuring Service Descrambling

This menu allows the user to select the services the AG 5800 will descramble using the CAM Module and Smart Card inserted into the DVB-CI module as shown in Figure 18. See Section 3.2.8.1 to configure the module. These options are applicable only if the Mode in the DVB-CI settings is set to Selected PIDs or Selected Services (Refer to Section 3.2.8.1). The drag and drop method can be used to drag services from the right column to the left column. The drop-down menu next to each selected service allows the user to choose either the bottom or top slot to descramble the service. If in Selected PIDs mode PIDs to descramble can be added manually by clicking  button. If in Selected Services mode, Services to descramble can be added manually by clicking the  button. The icons next to each service indicate whether the service is scrambled or not scrambled. Scrambled services will show the  icon next to them while services that are not scrambled will show the  icon. Clicking the  button forces the AG 5800 to rescan the transport stream for changes.

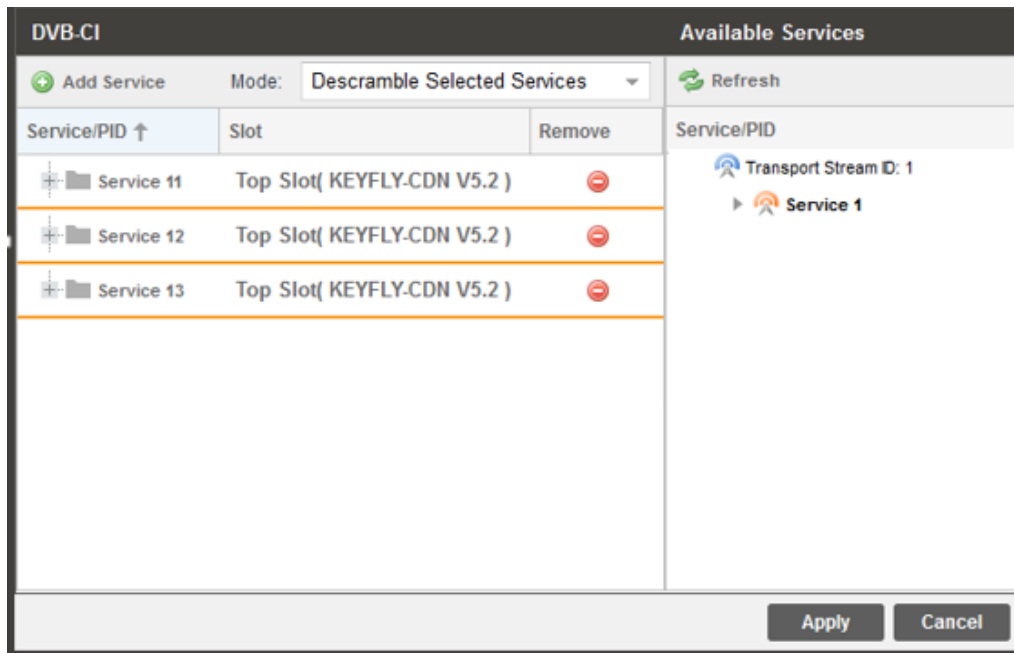

Figure 18: DVB-CI Service Descrambling Menu

3.2.9 Configuring Conditional Access

This section will describe how to configure descrambling in the AG 5800. The AG 5800 allows decoding of BISS 1 and BISS 2 with additional licensing.

Note: BISS 1 and BISS 2 descrambling are licensed separately.

3.2.9.1 BISS 1 Descrambling

This menu allows the user to configure BISS descrambling. 12 unique BISS keys can be entered. Clicking on the gear icon allows the user to configure BISS 1.

Setting	Range	Description
Operation Mode	Enabled Disabled	Enable / Disable BISS descrambling
Selected Key	Key 1 - 12	Select a key to configure
Alias	16 characters	Set an Alias for the selected key
Mode	Mode 1 Mode E	This setting sets the Mode of the BISS key that has scrambled the transport stream.
Mode 1 Session Word	N/A	If Mode 1 is selected the user enters the BISS session word here.
Mode E Session Word	N/A	If Mode E is selected the user enters the BISS session word here
Mode E Injected ID	N/A	If Mode E is selected the user enters the BISS injected ID here.

3.2.9.2 BISS 2 (BISS-CA) Descrambling

This menu allows the user to configure BISS descrambling. 12 unique BISS keys can be entered. Clicking on the gear icon allows the user to configure BISS 2.

Conditional Access

BISS Operation Mode: Disabled

Configure BISS

Operation Mode: Disabled

Mode E Injected ID	N/A	If Mode E is selected the user enters the BISS injected ID here
Mode CA Key Pair	Buried Injected	If Mode CA is selected the user will then select the type of conditional access. Buried or Injected
Mode CA Public Key	Download	If Mode CA Buried is selected, the user is able to download the Public Key from the

		AG 5800. The file will be generated as a .pub
Mode CA Private Key	Upload	If Mode CA Injected is selected, the user will need to upload the Private Key. The file name length must be less than 20 characters. The supported file types are .txt or .priv

3.2.10 Configuring Service Selection

This menu allows the user to configure the PIDs or Service the AG 5800 will decode. Depending on the Selection Mode that is set, the menu will change to reflect the applicable settings.

Service Lock

In Service Lock mode the AG 5800 is set to decode a specified service number or service name as shown in Figure 19. If the PIDs within the service change at any time, the AG 5800 will continue to decode the service. The drag and drop method can be used to populate the Service Name or Service Number dialog boxes.

The screenshot displays the 'Configure Service Selection' dialog box. It is divided into two main sections: 'Settings' on the left and 'Available Services' on the right.

Settings Section:

- Selection Mode:** A dropdown menu set to 'Service Lock'.
- On Backup:** A dropdown menu set to 'Use Primary Service'.
- Primary Section:**
 - Lock Mode:** A dropdown menu set to 'Service Number'.
 - Service Number:** A text input field containing the value '1'.
- Backup Section:**
 - Lock Mode:** A dropdown menu set to 'Service Name'.
 - Service Name:** A text input field containing the value 'Service 1'.

Available Services Section:

- A 'Refresh' button with a circular arrow icon.
- A table with two columns: 'Service/PID' and 'Bitrate (Mbps)'.
- The table contains one entry: 'Service 1' with a bitrate of '0.043'.

At the bottom right of the dialog box are 'Apply' and 'Cancel' buttons.

Figure 19: Service Lock Selection Menu

Setting	Range	Description
Selection Mode	Service Lock	Setting to <i>Service Lock</i> sets the card to decode any PIDs associated with a service number or service name. Setting to <i>PID Lock</i> sets the card to decode only the PIDs specified in the PID Lock Configuration matrix. <i>Auto Seek</i> mode will tune the card to the first service listed in the PAT if a transport stream is present.
	PID Lock	
	Auto Seek	
On Backup	Use Primary Service	Sets the service the AG 5800 will tune to in case of an input failover. If <i>Use Primary Service</i> is selected the AG 5800 will tune to the service name specified in the Primary section. If <i>Use Backup Service</i> is selected the service name specified in the Backup section will be tuned. How the AG 5800 fails over inputs is configured in Section 3.2.1
	Use Backup Service	
Lock Mode	Service Name	If set to <i>Service Name</i> the AG 5800 will decode only services matching the name specified (SDT in DVB or TVCT in ATSC tables must be present in this mode). If set to <i>Service Number</i> the AG 5800 will decode only services matching the number specified.
	Service Number	

Note: S302M Audio Type is now auto detected by the AG5800

PID Lock Mode

In PID Lock mode the AG 5800 will only decode the PIDs specified by the user in the PID Lock Configuration matrix as shown in Figure 20. The drag and drop method can be used to auto-populate the cells in the matrix. Stream types can be manually defined under the Primary Type and Backup Type columns. Individual cells under Primary and Backup columns can be selected and PIDs can be typed in manually.

Configure Service Selection

Apply Cancel

Figure 20: PID Lock Selection Menu

Setting	Range	Description
On Backup	Use Primary PIDs Use Backup PIDs	Sets the PIDs the AG 5800 will tune to in case of an input failover. <i>If Use Primary PIDs</i> is selected the AG 5800 will tune to the PIDs specified in the Primary PID column. If <i>Use Backup PIDs</i> is selected the service name specified in the Backup PID column will be tuned. How the AG 5800 fails over inputs is configured in Section 3.2.1.

Auto Seek Mode

In Auto Seek mode the AG 5800 will decode first service listed in the PAT as shown in Figure 21. All PIDs will automatically be assigned and decoded. No other configurations are available in this mode. This mode should only be used to verify the AG 5800 is receiving a valid signal and is able to decode. This mode is not recommended for a professional environment.

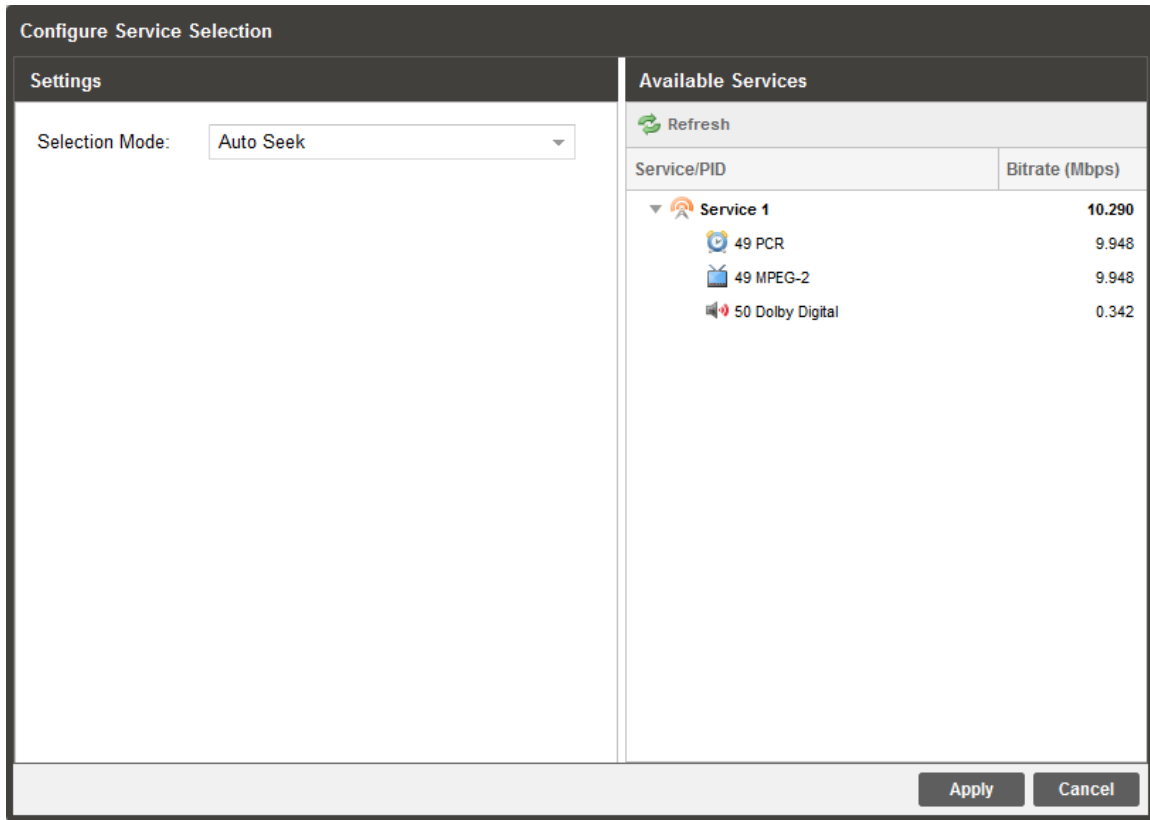

Figure 21: Auto Seek Menu

3.2.11 Configuring Video Services

The menu in Figure 22 allows the user to configure the SDI and Digital Video output formats of the AG 5800. Overlays and image insertion are configured in this menu as well.

Figure 22: Video Configuration Menu

Setting	Range	Description
Format Mode	Auto Manual	Setting to <i>Auto</i> the AG 5800 will output video to match the incoming native video format. Setting to <i>Manual</i> the user can define the video format the AG 5800 will output.
Manual Format	Refer to Appendix C for supported formats.	This setting is the video format the AG 5800 will output.
Raster Mode	Solid Color Last Frame	If no input is present the AG 5800 will output either the last frame present or raster

Raster Color	Black, White, Yellow, Cyan, Magenta, Red, Blue, Green, Gray	If no input is present the AG 5800 will output raster. This is the color of the video the AG 5800 will output.
4x3 Output Aspect Ratio Auto Conversion	Disabled AFD	If 4x3 Auto Conversion is set to <i>Disabled</i> the AG 5800 uses the 4x3 Conversion Mode setting to format video. If 4x3 Auto Conversion is set to <i>AFD</i> the AG 5800 will apply the conversion defined by the AFD code in the incoming stream. If 4x3 Auto Conversion is set to <i>AFD</i> , but the AFD code is not present or invalid in the incoming stream the 4x3 Conversion Mode setting will be used.
4x3 Output Aspect Ratio Conversion Mode	Center-Cut Letterbox Anamorphic	<i>Center-Cut</i> cuts off the top and bottom of the video. <i>Letterbox</i> adds bars at the top and bottom of the video. <i>Pillarbox</i> adds bars at the left and right of the video. <i>Anamorphic</i> stretches the video height and width to match the format mode.
16x9 Output Aspect Ratio Auto Conversion	Disabled AFD	If 16x9 Auto Conversion is set to <i>Disabled</i> the AG 5800 uses the 16x9 Conversion Mode setting to format video. If 16x9 Auto Conversion is set to <i>AFD</i> the AG 5800 will apply the conversion defined by the AFD code in the incoming stream. If 16x9 Auto Conversion is set to <i>AFD</i> , but the AFD code is not present or invalid in the incoming stream the 16x9 Conversion Mode setting will be used.
16x9 Output Aspect Ratio Conversion Mode	Center-Cut Pillarbox Anamorphic	<i>Center-Cut</i> cuts off the sides of the video. <i>Pillarbox</i> adds bars at the left and right of the video. <i>Anamorphic</i> stretches the video height and width to match the format mode.
Overlay Type	None Closed Captions DVB Subtitles Teletext Subtitles	<i>Closed Captions</i> overlays burns closed captioning in the video output. <i>DVB Subtitles</i> burns subtitles in video output. <i>Teletext Subtitles</i> burns subtitles in the video output. <i>None</i> disables overlays completely.
Closed Caption	NTSC DTVCC	Sets the type of closed captions that will be in the overlay.
NTSC Service	CC1 – CC4	Sets the NTSC closed caption service that will be displayed in the overlay. This setting is only available if the Closed Caption option is set to NTSC.
DTVCC Service	Service 1-6	Sets the DTVCC closed caption service that will be displayed in the overlay. This setting

		is only available if the Closed Caption option is set to DTVCC.
DVB Subtitles	Language Codes	If DVB Subtitles overlays are enabled this setting chooses the language which the subtitles are displayed. Only the languages present in the stream are given.
Teletext Subtitles	3 Hexadecimal Characters	If Teletext Subtitles overlays are enabled this setting choosing the page (language) of which subtitles are displayed. Only the pages present in the stream are given.

3.2.11.1 Configuring Image Overlay

This menu, when applicable, allows the user to configure the overlay trigger mode.

To add the configure overlay settings, select  **Video** under the Baseband Processing section. Navigate to the **Overlay** tab of the pop-up menu, this will then allow the user to configure an overlay into their stream.

Setting	Range	Description
Image Trigger	Disabled SCTE 35 Decode Failure Always Active	This setting will enable or disable the image overlay in the video output. The disable option will be the default setting. The SCTE 35 option will trigger the overlay based on a specific SCTE 35 event ID. The decode failure option will overlay the image if the video not decoding error is raised. Always active will always overlay the image in the video output.
SCTE35 Event ID		Specify the SCTE35 Event ID that will cause the image overlay to trigger.
Image Dithering	Enabled Disabled	Enable or Disable dithering of the uploaded image
Image Transition	Fade Cut	Specify if the image should fade in and out or cut in and out when using SCTE 35 or Decode Failure options
Overlay Image	Upload	This will allow the user to add a image in the form of a PNG or JPEG. A preview will be available after the image is uploaded.

The image overlay supports the use of transparent images to display a logo overlay with a transparent background. Transparent backgrounds are supported using the PNG file extension and can be configured using a 3rd party software.

The SCTE 35 mode, if selected, allows the user to enter a SCTE 35 Event ID to trigger the overlay of an image, or logo. Overlay images that are supported include PNG and JPEG with a maximum size of 4MB. Transparent images may also be used for logo overlay insertion.

The SCTE 35 mode allows the AG to automatically activate or deactivate the image overlay. When SCTE 35 is used, the overlay will automatically activate and deactivate depending the SCTE 35 message type used for the overlay trigger.

Setting	Range	Description
Out-of-Network(OON)	Activate	When a matching SCTE 35 splice event ID with OON signal is encountered, the system shall activate the image overlay.
Return-to-Network(RTN)	Deactivate	When a matching SCTE 35 splice event ID with a RTN signal is encountered, the system will deactivate the image overlay.
Out-of-Network(OON) with a break duration	Activate	When a matching SCTE 35 splice event ID with OON and a break duration flag is encountered, the system shall activate the image overlay and deactivate the image overlay after the specified break duration.
	Deactivate	

3.2.12 Configuring Audio

The menu in Figure 23 allows the user to configure the audio downmix settings or select a pair of discrete audio channels (if the 5.1 discrete audio license is present). Two audio presets are available: Transmission and Monitor. These presets can be applied by clicking the **Presets** button. The menus for Audio 1 through Audio 8 all contain the same settings.

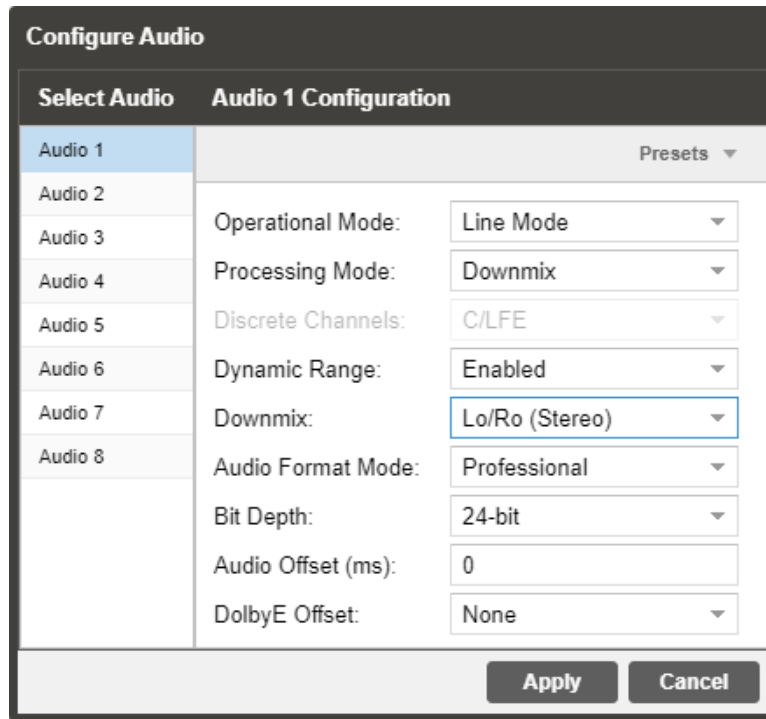

Figure 23: Audio Configuration Menu

Setting	Range	Description
Operational Mode	Line Mode	Refer to Appendix E for explanation.
	RF Mode	
	Custom 1	
	Custom 0	
Processing Mode	Downmix	Refer to Appendix E for explanation.
	Discrete	Refer to Appendix F for explanation
Discrete Channels	Lf/Rf	Selectable Pairs of Discrete Channels (Refer to Appendix F)
	C/LFE	
	Ls/Rs	
	Ch1/Ch2	
	Ch3/Ch4	
	Ch5/Ch6	
	Ch7/Ch8	
Dynamic Range	Enabled	Refer to Appendix E for explanation.
	Disabled	
Downmix	Lo/Ro (Stereo)	When the audio is downmixed in the AG 5800 two audio channels are created. The

	Lt/Rt (Dolby Surround)	channels can be configured using the settings available in the drop-down menu. (Refer to Appendix E)
	Lt/Rt (Auto)	
	Dual Mono/Stereo	
	Dual Left	
	Dual Right	
Audio Format Mode:	Consumer	This option selects the Dolby Digital format mode. (Refer to Appendix E)
	Professional	
Bit Depth:	20-bit	This setting allows the AES bit-depth to be 20-bit or 24-bit
	24-bit	
Audio Offset(ms):	-50 to +100 ms	This setting will adjust the audio output timing from -50 ms to +100 ms. This setting will affect all interfaces configured to output this audio service.
DolbyE Offset:	None	This setting will adjust the audio output timing for if this audio service is a DolbyE audio. Setting to <i>None</i> no timing changes are made. Setting to <i>Advance 1 Frame</i> will advance the audio 1 frame. This setting will affect all interfaces configured to output this audio service.
	Advance 1 Frame	

3.2.13 Configuring Genlock

If the Genlock Reference option was selected as a factory installed option, the following menus and options in Figure 24 will be available for configuration. This menu allows the user to configure the genlock reference used by the AG 5800. The AG 5800 can be configured to use an external user provided reference or disabled completely.

Configure Genlock

General

Reference Source: Disabled ▾

Genlock Offsets

SD Vertical (Lines):

HD Vertical (Lines):

HD Horizontal (Pixels):

Apply Cancel

Figure 24: Genlock Configuration Menu

Setting	Range	Description
Reference Source	Disabled External	Setting to <i>Disabled</i> will synchronize video output to the PCR carried in the transport stream. Setting to <i>External</i> uses the user provided external genlock reference.
SD Vertical (Lines)	-312 - 312	Plus or minus half of the number of lines in the genlock reference for SD formats.
SD Horizontal (Pixels)	-431 - 432	Plus or minus half of the number of pixels in the genlock reference SD formats.
HD Vertical (Lines)	-562 - 562	Plus or minus half of the number of lines in the genlock reference for HD formats.
HD Horizontal (Pixels)	-1374 - 1375	Plus or minus half of the number of pixels in the genlock reference for HD formats.

3.2.14 SCTE35

If the SCTE35 license is enabled, the following menus and options will be available for configuration. The SCTE35 to SCTE104 option is used in an application where the AG 5800 is receiving a transport stream with SCTE35 DPI splice messages.

In an SCTE 35 to 104 configuration, the AG 5800 extracts SCTE 35 messages from the transport stream and converts them to SCTE104 messages, and embeds them as VANC packets on the SDI output.

The SCTE 35 insertion option contains configuration settings for manually triggered or SNMP triggered SCTE 35 DPI splice messages.

The screenshot shows the 'Configure SCTE35' window. At the top, there are three tabs: 'General' (selected), 'Relays', and 'Insertion'. Below the tabs, there is a label 'Heartbeat Timeout (min):' followed by a text input field containing the value '10'.

Figure 25: SCTE35/ESAM General Configuration Tab

Setting	Range	Description
Heartbeat Timeout (min)	1-60	Setting this value will determine the time in minutes between SCTE35 messages before the AG 5800 will report an error

The screenshot shows the 'Configure SCTE35' window with the 'Insertion' tab selected. The 'General' and 'Relays' tabs are also visible. The 'State' is set to 'Disabled' and the 'PID' is '60'. Below this, there is a 'Select Message' list on the left and a 'Message 1 Configuration' section on the right. The 'Select Message' list includes 'Message 1' through 'Message 10'. The 'Message 1 Configuration' section contains the following settings: 'Splice Type' (Normal), 'Pre-Roll (ms)' (8000), 'Event ID (Hex)' (0), 'Network Event' (Out of Network), 'Break Duration (ms)' (30000), 'Unique Program ID' (0), 'Avail Num' (0), and 'Avails Expected' (0). At the bottom right, there are 'Apply' and 'Cancel' buttons.

Figure 26: SCTE35/ESAM Insertion Configuration Tab

Setting	Range	Description
State	Enabled Disabled	Enable or Disable SCTE 35 message Insertion
PID	0-8191	PID on which the inserted SCTE 35 messages will be inserted
Splice Type	Normal Immediate	Selects whether the SCTE 35 message will be of the “splice immediate” type (which can trigger an instantaneous switch downstream) or the normal type (which uses a PTS-based preroll value to time the insertion).
Pre-Roll (ms)	0-20000	Configured offset prior to splice point
Event ID (Hex)	0-FFFFFFFF	Unique Event ID for the SCTE 35 message
Network Event	Out of Network Return to Network	Select which network transition signal is used for the SCTE 35 message
Break Duration (ms)	0-95443717	Duration in ms of the Out of Network Break
Unique Program ID	0-65535	Unique program identification within a service
Avail Num	0-255	Authentication for a specific avail in the Unique Program ID
Avails Expected	0-255	Number of Avails expected in the current viewing event

Messages can be manually inserted by clicking the green arrow that is shown in Figure 27 when the SCTE 35 section is expanded. In a typical operational scenario, the splice insertion will be automated and triggered using the SNMP MIB.

Figure 27: Manual Message Insertion

3.2.15 ESAM

If the ESAM license is enabled, the menu and options in Figure 28 will be available for configuration. The AG 5800 interfaces with a Placement Opportunity Information Service (POIS) using the CableLabs ESAM (Real-time Event Signaling and Management) standard. When the ESAM feature is configured, each SCTE 35 message which is received in the incoming stream is sent to the POIS for processing (via the control interface). The POIS can request that the AG 5800 replace the message, pass the message with no change, or delete the message.

Asynchronous SCTE 35 message insertion allows the ESAM server to create and insert SCTE 35 messages onto a specified PID in the transport stream.

POIS URI	Valid String	Specify the address of the POIS server
POIS Timeout (sec)	1-5	Specify a timeout to receive a response from the POIS
Timeout Behavior	Pass Message Retry POIS Discard Message	Specify a behavior that is used by the AG 5800 if the timeout is reached
Acquisition Point ID	Valid String	Optional reference used by the POIS for processing
Acquisition Signal ID	Valid String	Optional reference used by the POIS for processing
State	Enabled Disabled	Enable or Disable Asynchronous message insertion

Port	0-65535	Port on which the AG 5800 will listen for SCTE 35 messages from the ESAM server
PID	SCTE 35 PID present in TS	PID on which the SCTE 35 messages will be inserted in the transport stream

3.2.16 Configuring Ancillary Data Options

The menu in Figure 29 allows the user to configure processing options relating to ancillary (ANC/VBI) data generation. Currently it contains options for Source ID and, if the SCTE35 license is enabled, it will also allow the user to configure the filter mode for SCTE104 messages.

Figure 29: Ancillary Data Configuration Menu

Setting	Range	Description
Lookup Mode	Auto Manual	Setting Lookup to auto will use the service information from the active stream (if present). Setting Lookup Mode to manual will allow the user to input a user defined source id.
Manual Source ID	ASCII Characters	User defined Source ID will need to be less than 14 characters
Timeout (sec)	5 – 120 sec	This will define the timeout for automatic extraction.
Filter Mode	Pass All Operations Pass First Operation	Setting Pass First Operation will filter SCTE 104 messages with multiple operations and only pass the first operation of that message.

3.2.17 Configuring SDI Outputs Port 1 & 2

The following menus (Figure 30 and Figure 31) allow the user to configure the embedded audio and auxiliary data in the SDI video output for port 1 & 2. There are unique settings for SD and HD video. All VANC embedding Line settings contain the values 4 through 19. All HANC embedding Line settings contain the values 5 through 15.

SCTE104	Enabled Disabled	Enable/Disable SCTE104 embedding in the VANC. Choose one line between lines 4-19 to embed data.

3.2.18 Configuring SDI Audio Embedding

This menu allows the user to configure SDI embedded audio settings. The AG 5800 comes standard with the ability to handle up to four audio services. With additional licensing the AG 5800 can handle up to eight unique audio services. When licensed for eight audio services the user will have eight audio pairs available to embed audio in the SDI. These four groups consist of eight pairs, with two pairs to each group. All audio pairs share the same options. The audio pairs can be configured for stereo or mono audio.

Configure SDI Output Port 1 & 2

SD HD **Audio**

Selecting Disabled turns off the Group Pair completely.
	Audio 1-8	
	Channel 1	
	or Channel 2	

3.2.19 Configuring Digital Audio Output

This menu allows the user to configure the digital audio outputs of the AG 5800. The number of outputs available directly correlates with the number of audio services the unit is licensed to support. Up to eight digital audio outputs are available. These four groups consist of eight pairs, with two pairs to each group. All audio pairs share the same options. The audio pairs can be configured for stereo or mono audio.

Configuring Digital Audio Output

Setting	Range	Description
Config	Stereo Mono	This allows for the Digital Output to be stereo audio or mono audio.

Stereo

Setting	Range	Description
Source	Off Audio 1-8 PCM Audio 1-8 Pass-through	Assigning a PCM audio to a digital output will output the decoded or downmixed two channel audio using the settings defined in Section 3.2.12. Assigning <i>Pass-Through</i> to a Digital Output will pass unprocessed compressed audio through to the Digital Output. Selecting Off disables the Digital Output completely.

Mono

Setting	Range	Description
Left Channel	Disabled Audio 1-8 Channel 1 or Channel 2	Assigning a Channel 1 or Channel 2 audio to a Digital Output will output the audio to the left channel using the settings defined in Section 3.2.12. Selecting Disabled turns off the left channel output.
Right Channel	Disabled Audio 1-8	Assigning a Channel 1 or Channel 2 audio to a Digital Output will output the audio to the right

Channel 1
or Channel 2

channel using the settings defined in Section 3.2.12.
Selecting Disabled turns off the right channel output.

3.2.20 PID Filter

If the PID/Service Filter license is enabled, the following menus and options will be available for configuration. PID filtering will allow the user to create a new output TS by selecting and dragging one or more services/PIDs from the incoming transport stream into the Selected Services/PIDs box or use the currently decoded stream. The user can also configure a TS bitrate for each PID filtered stream and select different table inclusion options.

Configure PID Filters

Selection Mode	Use Selected Services/PIDs	Use Selected Services/PIDs will allow the user to select which services are in the new TS. Use
	Use Decoded Service	Decoded Service will only include the service that is currently selected for decoding by the AG 5800

3.2.21 Configuring ASI Output

This menu (Figure 33) allows the user to configure the ASI output of the AG 5800. When enabled this output acts as an active loop output of the active input. For example, if the DVB-S/S2 input card is the current active input the ASI output port will output a demodulated signal of the satellite input.

Figure 33: ASI Output Configuration Menu

Setting	Range	Description
Direction	Input	Configure the ASI port to either an input or an output. Applies only to main board revision J or later. Main board version can be located on the about tab under the Options section.
	Output	
Port	Enabled	Enable or disable the ASI output port.
	Disabled	
Source	Unmodified Input	Unmodified Input will pass the incoming TS to the output without applying any BISS or DVB-CI decryption
	Descrambled	Descrambled (or Descrambled and Processed) will output the TS with any applied BISS or DVB-CI decryption.
	Descrambled and Processed	
	PID Filter 1-10	
		PID Filter will output the TS from the PID filter menu option.

3.2.22 Configuring the MPEG/IP Outputs

The menu in Figure 34 allows the user to configure the MPEG/IP outputs. The backplane has two ports that can be set to receive and/or transmit. This menu is for setting up the transmission of MPEG/IP unicast or multicast transport streams. The menu for Stream 1 and 2 has the same settings. The menu for Streams 3 through 10 will contain the same options as Transmit 1 and Transmit 2 with one exception: Forward Error Correction is only available (if licensed) on Transmit 1 and 2.

Configure MPEG/IP Slot 2 Stream 1

General Settings

Transmit: Disabled

Source: Unmodified Input

Physical Connector: Port 1

Destination IP: 239.192.0.200

Destination Port: 10000

Source Port: 3020

TS Packets Per IP Packet: 7

Differentiated Services: Default

Encapsulation: UDP

Advanced Settings

FEC: Off

FEC Columns: 4

FEC Rows: 4

Apply Cancel

Figure 34: MPEG/IP Transmit Configuration Menu

Setting	Range	Description
Transmit	Enabled Disabled	Enable or disable the MPEG/IP transmit group.
Source	Unmodified Input Descrambled	Unmodified Input will pass the incoming TS to the output without applying any BISS or DVB-CI decryption.

	Descrambled and Processed PID Filter 1-10	Descrambled (or Descrambled and Processed) will output the TS with any applied BISS or DVB-CI decryption. PID Filter will output the TS from the PID filter menu option.
Physical Connector	Port 1	The AG 127 physical connector on the backplate that will be used to transmit the output.
	Port 2	
	Port 1 (Card)	The AG 128 physical connector on the backplate that will be used to transmit the output.
	Port 2 (Chassis)	
Destination IP	Multicast - 224.0.0.0 - 239.255.255.255	When sending to a unicast address the destination IP address must match the receiving device's IP address. When sending a multicast, the address must be sent within the multicast IP range.
Destination Port	0 - 65535	When sending to a unicast address, the destination port must match the receiving device's port. When sending a multicast, any port within the accepted range can be used, but it is good practice to always choose a port >1030 and an even number
Source Port	0 - 65535	This is the port used by the AG 5800 to transmit the MPEG/IP stream.
TS Packets Per IP Packet	1-7	The number of TS packets that are contained with a single IP packet. Default is 7. Lowering this value below default increases network overhead.
Differentiated Services	Default	Define the quality of service (QoS) classification the packets carry when transmitted.
	Assured Forwarding 1-1 to 4-3	
	Expedited Forwarding	
Encapsulation	UDP	Sets the Encapsulation to UDP or RTP.
	RTP	
FEC	Off	Sets the FEC Type or disables FEC.
	Columns	
	Columns/Rows	
FEC Columns	1-20 (Columns)	Defines the number of Columns used to construct the FEC Matrix. (Columns * Rows must be ≤ 100.)
	4-20	
	(Columns/Rows)	
FEC Rows	4-20	Defines the number of Rows used to construct the FEC Matrix. (Columns * Rows must be ≤ 100.)

3.2.23 Configuring the MPEG/IP MPE Outputs

This menu allows the user to configure the MPEG/IP Multi-Protocol Encapsulation (MPE) outputs. Each MPE Output allows the user to select an MPE data PID from the transport stream to be output.

Setting	Range	Description
Transmit	Enabled Disabled	Enable or disable transmission of de-encapsulated MPE data.
Physical Connector	Port 1 Port 2 Port 1 (Card) Port 2 (Chassis)	The physical connector on the AG 127 MPEG/IP card that will be used to transmit the MPE data. The physical connector on the AG 128 MPEG/IP card that will be used to transmit the MPE data.
PID		Selected MPE PID from the transport stream to use for MPE output
MAC Filter State	Enabled Disabled	Enable or Disable the filtering of output data based on a MAC address in the selected MPE PID
MAC Address	00:00:00:00:00:00 FF:FF:FF:FF:FF:FF	Filtered MAC address that will be transmitted in the MPE output. All data with other MAC addresses in the selected MPE PID will be discarded

Viewing PSIP Information

To view the PSIP information for the applied TS, select the View PSI Tables button located on the right-hand side of the Inputs section. This will open a new window that displays all of the PSIP information for the applied TS. The tables displayed will include PAT, PMT and CAT and tables associated with the stream type (DVB, ATSC). SDT tables will be displayed for DVB streams and MGT, TVCT, EIT, ETT, STT tables will be displayed for ATSC streams.

The screenshot shows a window titled "View PSI Tables". It is divided into two main sections: "PSI Tables" on the left and "PAT Details" on the right. The "PSI Tables" section has a "Refresh" button at the top, a "Service/PID" label, and a list showing "0 PAT". The "PAT Details" section displays the following information:

- PID: 0
- Version: 11
- TS ID: 1
- Program Count: 1

Below this information is a table titled "PMTs" with the following data:

PID	Version	Program Number	ES Count
48	8	1	2

A "Close" button is located at the bottom right of the window.

Clicking the Refresh button in the upper left corner will update the tables displayed.

3.3 Admin Panel

The screenshot displays the Admin Control Panel with the following sections:

- General Settings:**
 - Unit Alias: MLB Card 3
 - Protect BISS-E Injected ID: Yes
 - PID Display Mode: Decimal
 - ASI Out/Video Sync Function: ASI Out
- Unit Network Configuration:**
 - Configure Control Ports: Hostname: (none), Default Gateway: Control Port 1, Primary Nameserver: 172.16.0.86, Secondary Nameserver: 172.16.0.153

Control Port	Physical Connector	Mode	IP Address	Subnet Mask	Gateway	MAC
Control Port 1	Network 1	Static	10.0.108.103	255.255.0.0	10.0.1.3	00:06:4D:01:C0:41
Control Port 2	None	DHCP	0.0.0.0	0.0.0.0	0.0.0.0	00:06:4D:02:C0:41
- MPEG/IP Network Configuration:**
 - License Information:

Option	Supported	State	Instances
AG 58701 - Genlock	Yes	Licensed	1
AG 58710 - HD 4:2:0 Video Decoding License	Yes	Licensed	1
AG 58720 - HD 4:2:2/4:2:0 Video Decoding License	Yes	Unlicensed	0
AG 58740 - 3G-SDI/1080p60 Video Output	Yes	Unlicensed	0
AG 58800 - 4x->8x Audio Service Decoding Upgrade	Yes	Unlicensed	0
AG 58916 - DVB-S2 Advanced Feature	No	Unlicensed	0
AG 58921 - BISS Descrambling	Yes	Unlicensed	0
AG 58925 - IP FEC Output	Yes	Licensed	1
AG 58928 - PID/Service Filter License	Yes	Unlicensed	0
AG 58991 - DVB-CI Multi-Service Descrambling	No	Unlicensed	0
AG 58992 - SCTE 35 to 104 Output License	Yes	Unlicensed	0

Figure 35: Admin tab

To access the Admin Control Panel (Figure 35), click on the **Admin** tab. This menu allows the user to control many aspects of the AG 5800.

3.3.1 Changing Unit Password

The AG 5800 can be assigned an access password and the current access password can be changed. In order to make changes to passwords, click the

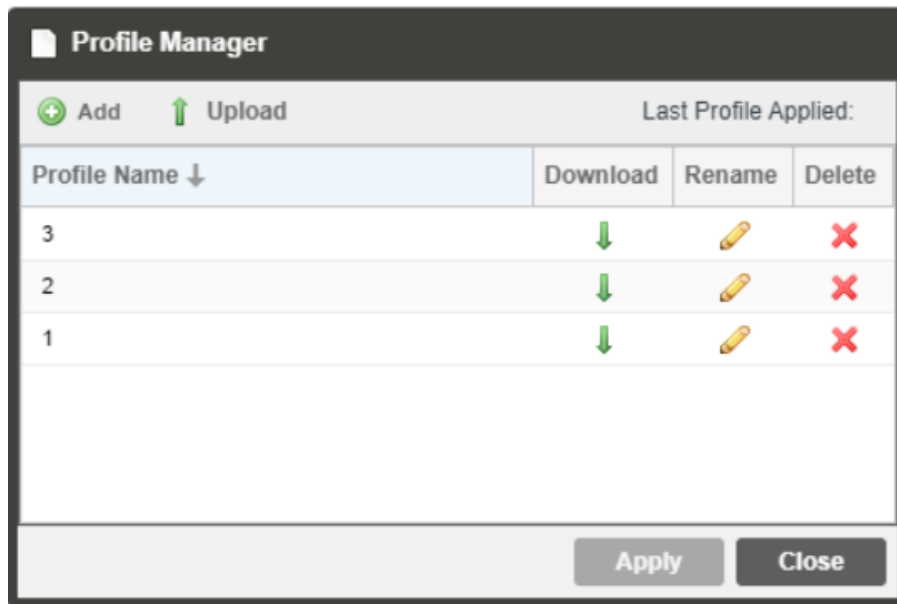

button. A window will appear to enter the current password and new password.

The Change Password dialog box contains the following elements:

- Title: Change Password
- Field: New Password: [Text Input]
- Field: Confirm Password: [Text Input]
- Buttons: Apply, Cancel

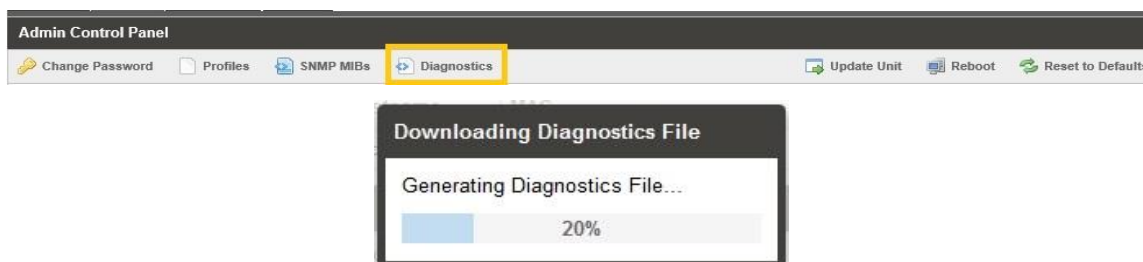

3.3.2 Profiles

The AG 5800 has the ability to save all configured settings to multiple profiles. Profiles can be saved locally, renamed and saved to external storage to be used on other AG 5800s with the same hardware, licensing, and software version. Profiles can be used to quickly and easily change the configuration of an AG 5800 to suit different inputs and decoding requirements.

Action	Button	Description
Add New Profile	 Add	Adds a new profile from current settings. User must name profile before creation is complete.
Upload Profile	 Upload	Allows the user to browse to external storage or workstation to upload profile to AG 5800.
Apply Profile	 Apply	Select a profile from the drop-down menu and click this button. The AG 5800 will apply all settings contained in the profile selected.
Rename Profile		Select a profile from the drop-down menu and click this button. The user will be prompted for a new name for the profile.
Delete Profile		Select a profile from the drop-down menu and click this button. The user will be prompted to confirm deletion of the profile.
Download Profile		Select a profile from the drop-down menu and click this button. The user will be prompted to select a directory to download the profile.

3.3.3 Diagnostics

The AG 5800 provides the user the ability to take a snapshot of ALL current unit settings, reported values, active alarms, and the alarm and log file history. This snapshot will be downloaded as a .XML format file that can be sent to Procure at Sencore for analysis.

Click the 'Diagnostics' button and a window will open showing the diagnostic file creation progress.

This window is replaced with a download file window when file creation is complete.

The user will be asked to 'Open' or 'Save' the file.

3.3.4 General Settings

The AG 5800 can be assigned an alias which is displayed in the upper right-hand corner of the web interface as shown in

Figure 37. The alias can help define which AG 5800 the operator is currently logged into. The BISS-E Injected ID for BISS Mode E can also be protected from being accidentally changed. Setting the Protect BISS-E Injected ID to "Yes" will force the user to unlock the dialog box in the BISS Descrambling configuration menu before allowing any changes to be made. To edit the Unit Alias or protect the BISS-E Injected ID click on the

button (Figure 36). The PID Display mode changes how PID values are displayed in the web interface. The values can either be displayed in decimal or HEX values. The ASI Out/Video Sync Function is for special applications purposes. This should remain set to ASI Out.

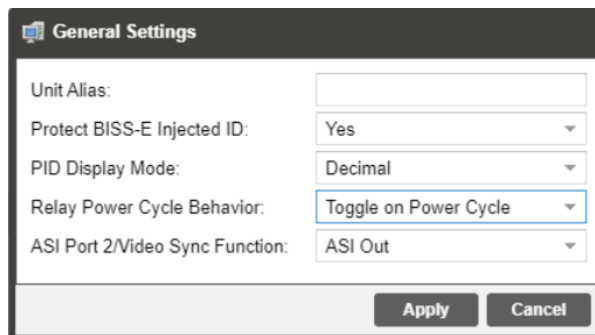

Figure 36: General Settings Configuration Menu

Figure 37: Alias Name

3.3.5 Unit Network Configuration

The management port of the AG 5800 can be configured from the web interface. To make changes to the management port, click the  button under the Unit Network Configuration section. Domain name servers can be configured on the AG clicking the  **Configure Nameservers** button. IP address and web address entries are accepted as Nameserver addresses.

Configure Nameservers	
Primary Nameserver:	172.16.0.86
Secondary Nameserver:	172.16.0.153
<div>Apply Cancel</div>	

If the AG 5800 contains a 58127 option card, the unit can be configured to have an optional 2nd control port.

NOTE: Exercise extreme caution when performing changes to this menu as network communication can be lost with the AG 5800.

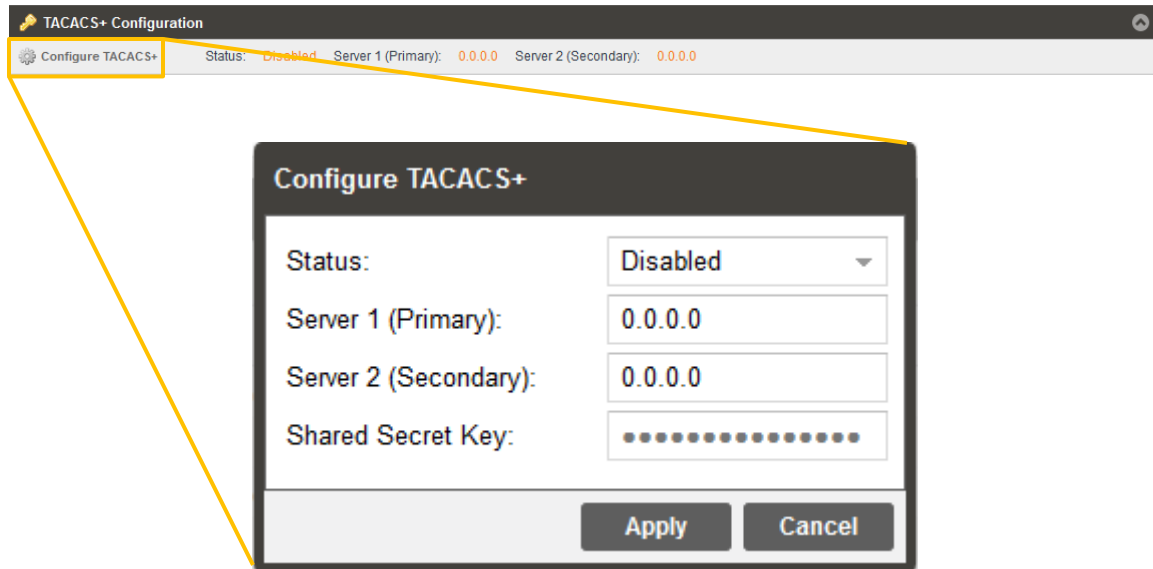

Configure TCP Settings	
Mode:	Static
Hostname:	(none)
Static Settings	
IP Address:	10.0.15.36
Subnet Mask:	255.255.0.0
Gateway:	10.0.1.3
<div>Apply Cancel</div>	

Setting	Range	Description
Mode	DHCP Static	Setting to <i>DHCP</i> will allow the network assign an IP address automatically to the AG 5800 (if supported). Setting to <i>Static</i> allows the user to manually define all TCP/IP settings for the management port.
Hostname	Valid characters: A through Z 0 through 9 - (hyphen)	This setting allows the user to define an optional unit Hostname.
IP	Four decimal octets: XXX.XXX.XXX.XXX	This option is only available if Static Mode is set. This is the IP address assigned to the management port.
Subnet Mask	255.0.0.0 – 255.255.255.254	This option is only available if Static Mode is set. This is the Subnet Mask assigned to the management port.
Gateway	Four decimal octets: XXX.XXX.XXX.XXX	This option is only available if Static Mode is set. This is the Gateway address assigned to the management port.

The 2nd management port of the AG 5800 can be configured from the web interface. To make changes to which port is the 2nd management port click, the configure control ports  button under the Unit Network Configuration section.

3.3.6 TACACS+ Configuration

This feature is to be implemented in tandem with a primary and secondary TACACS+ server that the AG 5800 can reference. The external TACACS+ server will handle user authentication using shared keys.

TACACS+ Configuration Menu

Setting	Range	Description
Status	Enabled Disabled	Enabling this will make the “Login Type” dropdown and “TACACS+” option appear in the login prompt shown in Section 3.1.1.
Server 1 (Primary)	1.0.0.0 - 126.0.0.0 128.0.0.0 - 191.255.0.0	The IP of the TACACS+ server(s).
Server 2 (Secondary)	192.0.1.0 - 223.255.255.0	
Shared Secret Key	Administrator defined	The shared key for all devices to be authenticated by the TACACS+ server.

3.3.7 MPEG/IP Network Configuration

The MPEG/IP option is used to receive MPEG over IP transport streams. The MPEG/IP option supported unicast, multicast, UDP and RTP. The ports on the AG 5800 backplane can be configured from the web interface. To configure the Default Gateway and ICMP Response settings (Figure 38) click the  **Configure Card** button.

Figure 38: MPEG/IP Configuration Menu

Setting	Range	Description
Default Gateway	Port 1	AG 127 setting to <i>Port 1</i> uses the gateway address of port 1 as the default gateway. Setting to <i>Port 2</i> uses the gateway address of port 2 as the default gateway.
	Port 2	
	Port 1 (Card)	AG 128 setting to <i>Port 1 (Card)</i> uses the gateway address of port 1 as the default gateway. Setting to <i>Port 2 (Chassis)</i> uses the gateway address of port 2 as the default gateway.
	Port 2 (Chassis)	
ICMP Response	Enabled	Setting to enabled allows the AG 5800 to respond to ICMP requests (ping). If disabled the AG 5800 will not respond to these requests.
	Disabled	

To configure the TCP/IP settings of the MPEG/IP ports click the  button under the MPEG/IP Network Configuration section next to the corresponding port. The settings for both ports are the same as shown in Figure 39.

Configure MPEG/IP Slot 2 Port 1

IP Address: 10.0.0.71

Subnet Mask: 255.255.255.0

Gateway: 0.0.0.0

Link Speed: Auto

Apply Cancel

Figure 39: MPEG/IP Port Configuration Menu

Setting	Range	Description
IP Address	1.0.0.0 - 126.0.0.0 128.0.0.0 - 191.255.0.0 192.0.1.0 - 223.255.255.0	This setting is the TCP/IP address assigned to the port.
Subnet Mask	255.0.0.0 – 255.255.255.254	This setting is the subnet mask assigned to the port.
Gateway	1.0.0.0 - 126.0.0.0 128.0.0.0 - 191.255.0.0 192.0.1.0 - 223.255.255.0	This setting is the gateway address assigned to the port.
Link Speed	Auto 1000Mbps/Full 1000Mbps/Half 100Mbps/Full 100Mbps/Half 10Mbps/Full 10Mbps/Half	Setting Link Speed to Auto allows the AG 5800 to determine the link speed of the network. If this is not possible or the user wants to define a link speed select one of the other values available.

3.3.8 Licensing

Certain features of the AG 5800 require licenses in order to be functional. The interface displays all licenses available as well as the following status:

- License Locked or Unlocked
- License is Supported or Unsupported by the installed hardware

If licenses need to be applied to the AG 5800 click  **Apply License Key** button. The menu in Figure 40 will appear where the user can copy and paste the provided license key from Sencore.

A dialog box titled "Enter License Key" with a dark header bar. Inside, there is a large text input field with the placeholder text "Enter a new license key here...". At the bottom right of the dialog, there are two buttons: "Apply" and "Cancel".

Figure 40: License Key

3.3.9 Date/Time

The AG 5800 can be set to synchronize with an NTP server or a manual date and time can be defined by the user. Click the  **Configure Date / Time** button to configure the date and time as shown in Figure 41. These values are used to timestamp entries in the Alarm and Event logs under the Reporting tab.

A configuration window titled "Configure Date / Time" with a dark header bar. It contains several input fields: "Update Mode:" with a dropdown menu showing "Manual"; "NTP Server:" with a text field showing "0.0.0.0"; "Date:" with a text field showing "1970-01-02" and a calendar icon; and "Time:" with a text field showing "19:32:53". Below these fields is a note: "Note: Changing time may prompt you to log-in." At the bottom right, there are "Apply" and "Cancel" buttons.

Figure 41: Date/Time Configuration Menu

Setting	Range	Description
Update Mode	NTP Manual	Setting to <i>NTP</i> uses the local network's NTP server to synchronize date and time. <i>Manual</i> allows the user to define a date and time.
NTP Server	Four decimal octets: XXX.XXX.XXX.XXX Domain Name	This is the IP Address or Domain Name of the local NTP Server on the network. This setting is only available if Update Mode is set to NTP.
Date	MM/DD/YYYY	This setting is the user defined date. A calendar widget can be used to select the data by clicking the  button. This setting is only available if Update Mode is set to Manual.
Time	00:00:00 – 24:00:00	This setting is the user defined time. The time is based on a 24 hour clock. This setting is only available if the Update Mode is set to Manual.

3.3.10 Configuring SNMP

3.3.10.1 SNMP Communities

SNMP Communities define whether users have read-only or read-write SNMP rights. These two communities are given unique names. The default names for these communities are:

- Read –Only Community: public
- Read- Write Community: private

To modify the names of these communities, click on the

 **Configure SNMP Communities** button as shown in Figure 42.

The image shows a configuration window titled "SNMP Community Strings". It contains two text input fields. The first field is labeled "Read-Only Community:" and contains the text "public". The second field is labeled "Read-Write Community:" and contains the text "private". At the bottom right of the window, there are two buttons: "Apply" and "Cancel".

Figure 42: SNMP Community Configuration Menu

3.3.10.2 SNMP Trap Managers

The SNMP trap managers are recipients of SNMP traps sent from the AG 5800. The following menu allows the user to configure the recipient's IP addresses. To add and remove recipients of the SNMP traps click the

 **Configure SNMP Communities** button (Figure 43).

Figure 43: SNMP Managers

Action	Button	Description
Add Manager	 Add Manager	Clicking this button prompts the user for the IP address of the SNMP trap manager.
Delete All	 Delete All	Clicking this button prompts the user to confirm the deletion of all SNMP trap manager IP addresses. If the user confirms deletion all SNMP trap manager IP addresses will be removed.
Delete Single Entry		Highlight a single SNMP trap manager IP address and click this button to delete the entry. A prompt will appear confirming the deletion of IP address.

3.3.10.3 Download SNMP MIB Files

The AG 5800 stores the SNMP MIB files for the currently installed version of software on the unit. These files can be downloaded directly from the AG

5800 by clicking on the  button. The screen in Figure 44 will appear where the files can be downloaded and saved off of the unit.

Index of /mibs/				
Name	Last Modified	Size	Type

Figure 44: Available MIBs

3.3.11 Syslog

The AG 5800 can be configured to send error and event logs formatted in the syslog protocol to a remote user specified Syslog server.

The image shows a 'Configure Syslog' dialog box with the following fields and values:

- State: Enabled (dropdown menu)
- Network Protocol: UDP (dropdown menu)
- IP Address: 172.16.14.38 (text input)
- Port: 514 (text input)

At the bottom right, there are 'Apply' and 'Cancel' buttons.

Figure 45: Syslog Configuration Menu

Action	Range	Description
State	Enabled	Enable or Disable sending messages to Syslog server.
	Disabled	
Network Protocol	UDP	Select which network protocol used to transmit to the Syslog server
	TCP	
IP Address	Four decimal octets: XXX.XXX.XXX.XXX	IP of the Syslog server. 0.0.0.0 and 255.255.255.255 are not permitted
Port	0 - 65535	Destination port of the Syslog server

3.3.12 In-Band Control

The In-Band Control is used to change settings and receive updates from data within a PID in the incoming TS, as injected by the Sencore CMD 4000 In-band Control Server. The menu in Figure 46 allows the user to configure the In-Band Control settings. To configure the In-Band Control settings click the

 **Configure In-Band Control** button.

Figure 46: In-Band Control Configuration Menu

Action	Range	Description
State	Enabled	Enable or Disable the In-Band Control.
	Disabled	
PID	1-8190	Sets the unit to look for commands on the PID that is set.
Group	None	This setting assigns the unit to a corresponding Group or No Group.
	1-128	

3.3.13 Updating the AG 5800

3.3.13.1 Applying Software Updates

Updates to the AG 5800 are performed through the web interface. A software update file is provided by Sencore and then uploaded to the unit. Once uploaded, the software update is applied to the unit. To upload software updates to the unit, click on the  button. The current version and uploaded version are displayed in the Software Versions section as shown in Figure 47. The AG 5800 will reboot after a software update is complete.

Figure 47: Update Unit Menu

Note: When updating from software versions older than 3.0.0 to 4.3.0 or newer the password may be changed to mpeg101

Note: When updating from software version 3.0.0 or newer, the existing password will be retained

Action	Button	Description
Upload Software Update		To upload software updates to the AG 5800 click this button. The user will be prompted to navigate to an update file. The file will then upload to the AG 5800. When complete the AG 5800 will prompt the user to either apply the update or cancel.

Delete the Uploaded Software		Clicking this button prompts the user to confirm the deletion of the software update from the AG 5800. This will also clear the Uploaded Version status of the Software Versions section.
Update Software to Uploaded Version		Clicking the button starts the software update process. The AG 5800 will prompt the user to confirm the update. Click Yes to continue or No to cancel.

3.3.13.2 Rollback Software Updates

The AG 5800 is capable of reverting back to a previous version of software using the Rollback feature. The AG 5800 maintains two separate software images; one is the most current version of software with all current settings and the other is the previous version of software with all settings. To perform a rollback, click the  button and then click the **Rollback** tab. The AG 5800 will reboot after the rollback process is complete.

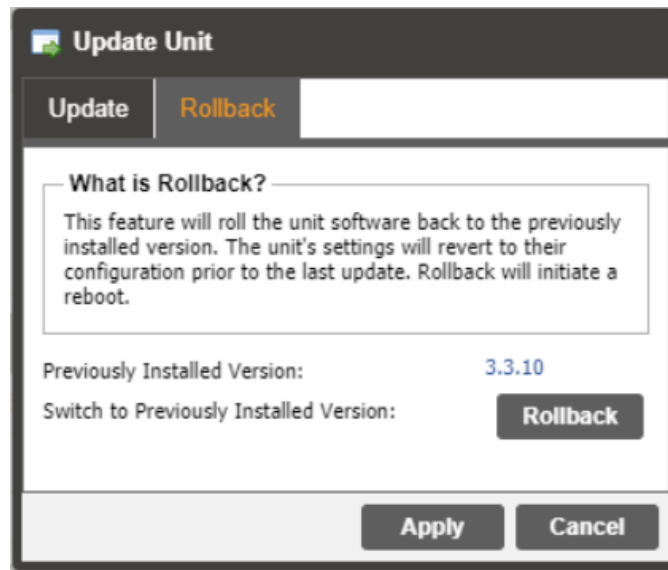

Figure 48: Rollback Unit Software Menu

Action	Button	Description
Rollback Software		Clicking this button starts the Rollback process. The AG 5800 will prompt the user to confirm the rollback or click cancel to stop the process.

3.3.14 Reboot Unit

The AG 5800 can be rebooted from the web interface. In order to perform a reboot, click the  **Reboot** button. The AG 5800 will prompt the user to confirm the reboot. Once the reboot is complete the login screen will appear allowing the web interface to be logged into.

3.3.15 Reset Defaults

The AG 5800 settings can be reset to factory defaults. All settings will be returned to the factory defaults except the network management ports TCP/IP settings. All event logs will be cleared. To reset all settings to default, click the  **Reset to Defaults** button. The AG 5800 will prompt the user to confirm the reset. The unit will reboot once the reset is confirmed.

3.4 Reporting Panel

Main	Admin	Reporting	About
Reporting Control Panel			
Alarms		Logs	
State	Name	Location	Last Changed

Figure 49: Error Reporting Page

The **Reporting** tab in the AG 5800 contains logs for active alarms currently affecting the unit and an event log as shown in Figure 49. The active alarms are updated periodically in order to reflect the real-time state of the unit. Once an error is cleared it will be cleared from the active alarms window. The event log can be used to view alarm and event history. Both the active alarm and event logs can be configured to hide or change the behavior of alarms and events.

3.4.1 Active Alarms

Clicking on the  button displays the Active Alarms menu shown in Figure 50. This list displays all the active alarms currently affecting the unit. There are four columns in the log that display different types of information.

Main	Admin	Reporting	About
Reporting Control Panel			
Alarms		Logs	 Configure
State	Name	Location	Last Changed
	TS Sync Loss	Input ASI 1	1970-01-01 03:15:11
	Transport Stream Not Present	Unit	1970-01-01 00:01:52
	TS Sync Loss	Input Turbo PSK Slot 1	1970-01-01 03:25:33
	Loss of Carrier Lock	Input Turbo PSK Slot 1	1970-01-01 03:25:33

Figure 50: Active Alarms

Title	Description
State	This column displays the nature of the alarm. The  icon means the log entry is informational and is not an error. The  icon means the log entry is an active alarm.
Name	This column displays the description of the error. The function that is experiencing an error condition is described here.
Location	This column displays the hardware or function that is experiencing the active error.
Last Changed	This column displays the date and time the error was raised. This date and time correlates with the Date and Time settings configured in Section 3.3.9.

3.4.2 Event Logs

Clicking on the  button displays the Event Log menu shown in Figure 51. This list displays all of the events and alarms that have affected the unit. The AG 5800 stores up to four days' worth of logs. The logs can be cleared manually by clicking the  button. The logs can be downloaded as a .tsv file and saved to an external location by clicking the  button. There are five columns in the log that display different types of information.

	1970-01-01 00:52:56		Input ASI 1	TS Sync Loss Error
	1970-01-01 00:52:55		Input MPEG/IP Slot 2 Stre...	TS Sync Loss OK
	1970-01-01 00:52:55		Input MPEG/IP Slot 2 Stre...	IP Loss OK

Severity: Info Error

Transition: Event Went Good Went Bad

Figure 51: Condition and Event Log

Title	Description
Severity	This column displays the nature of the alarm. The icon means the log entry is informational and is not an error. The icon means the log entry is an active alarm.
Timestamp	This column displays the date and time the error was raised or cleared. This date and time correlates with the Date and Time settings configured in Section 3.3.9.
Transition	This column displays when an alarm transition from a bad to good state. When an error is raised the icon is displayed. When an error is cleared the icon is displayed. When an event takes place the icon is displayed.
Message	This column displays the description of the error or event. The function or hardware that experienced the event or error is described here.
Location	This column displays the hardware or function that experienced the alarm or event.

3.4.3

3.4.4 Configuring the Logs

The AG 5800 allows the user to configure alarms and events. Events and alarms can be hidden or set to send SNMP traps. In order to configure these options, click the  **Configure** button while in the **Reporting** tab. The **Conditions** tab allows the user to configure the alarms reported by the AG 5800. The **Events** tab allows the user to configure the events reported by the AG 5800. Each column and its function are described below. A user configured time offset can also be applied to allow viewing the logs in a local time zone.

Name	Location	Log <input type="checkbox"/>	Severity	Alarm <input type="checkbox"/>	SNMP Trap <input type="checkbox"/>	Relay <input type="checkbox"/>	Relay #
12V Supply Error	Unit	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
3.3V Supply Error	Unit	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
5V Supply Error	Unit	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
AFD not Present	Decoder	<input checked="" type="checkbox"/>	Error	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - AFD	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - AMOL	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - CC	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - EN301775	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - OP47	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - RDD11	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - SCTE127	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - SMPTE2038	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1
ANC/VBI Line Conflict - Source ID	Primary Video Output	<input checked="" type="checkbox"/>	Error	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	Relay 1

Figure 52: Conditions and Events Configuration Menu

Title	Description
Name	This column displays the name of the error or condition. This is informational data; no options can be set here.
Location	This column displays the hardware or function that the alarm or event applies to. This is informational data; no options can be set here.
Log	Checking the box in this column creates an entry in the event log in the case this error or event is raised. If this box is unchecked this error or event will be hidden and not logged if raised.
Log Severity	This column is only available in the Conditions tab This option allows the user to set the severity of the error to Info or Error. If Info is selected in the drop-down box, the  icon will be displayed in the event log. If Error is selected the  icon will be displayed in the event log.
Alarm	This column is only available in the Conditions tab This option allows the user to enable or disable this alarm in the Active Alarms log. If checked

the alarm will be displayed in the Active Alarms log if raised. If this box is unchecked this error will be hidden.

SNMP Trap

This column allows the user to send an SNMP Trap if this alarm is raised. If this box is checked an SNMP Trap is sent when this alarm is raised. If this box is unchecked an SNMP is not sent.

3.5 About Panel

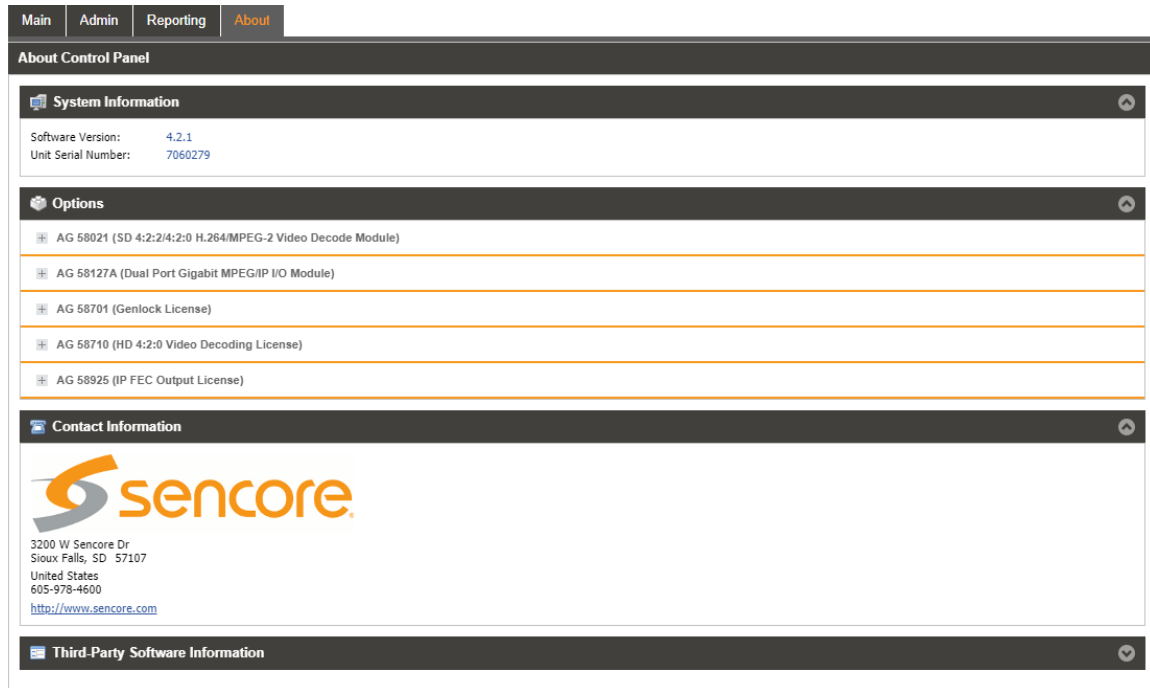

Figure 53: About tab

Under the **About** tab, there are no user definable parameters but there is information about software versions currently installed, which licenses are installed, how to contact Sencore, and third-party software information.

Section 4 Appendices

Introduction

This section includes the following appendices:

Appendix A	– Acronyms and Glossary	96
Appendix B	– Error and Event List.....	99
Appendix C	– Specifications.....	102
Appendix D	– AG 5800 Audio Explanation	111
Appendix E	– AG 5800 Discrete Audio Configuration	114
Appendix F	– Open Source Software.....	116
Appendix G	– CRD 1900 Chassis.....	118
Appendix H	– Warranty	120
Appendix I	– Support and Contact Information	120

Appendix A – Acronyms and Glossary

8VSB: Vestigial sideband modulation with 8 discrete amplitude levels.

16VSB: Vestigial sideband modulation with 16 discrete amplitude levels.

AAC: Advanced Audio Coding

AC-3: Also known as Dolby Digital

AES: Audio Engineering Society

AFD: Active Format Descriptor

ASI: Asynchronous Serial Interface

ATSC: Advanced Television Systems Committee

AV: Audio Video

Bit Rate: The rate at which the compressed bit stream is delivered from the channel to the input of a decoder.

BNC: British Naval Connector

BPS: Bits per second.

CAM: Conditional Access Module

CAT: Conditional Access Table

CAT6: Category 6 – Cable standard for gigabit Ethernet

CC: Closed Caption

CI: Common Interface

CoP: Code of Practice

CRC: Cyclic Redundancy Check

CVCT: Cable Virtual Channel Table

dB: Decibel

DDPlus: Dolby Digital Plus

DHCP: Dynamic Host Configuration Protocol

DPI: Digital Program Insertion

DTVCC: Digital Television Closed Captioning

DVB: Digital Video Broadcasting

EBU: European Broadcasting Union

EIA: Electronic Industries Alliance

EIT: Event Information Table

EPG: Electronic Program Guide

ETM: Extended Text Message

ETT: Extended Text Table

Event: An event is defined as a collection of elementary streams with a common time base, an associated start time, and an associated end time.

FCC: Federal Communications Commission

FEC: Forward Error Correction

Field: For an interlaced video signal, a “field” is the assembly of alternate lines of a frame. Therefore, an interlaced frame is composed of two fields, a top field and a bottom field.

Frame: A frame contains lines of spatial information of a video signal. For progressive video, these lines contain samples starting from one time instant and continuing through successive lines to the bottom of the frame. For interlaced video a frame consists of two fields, a top field and a bottom field. One of these fields will commence one field later than the other.

HANC: Horizontal Ancillary

HD: High Definition

High level: A range of allowed picture parameters defined by the MPEG-2 video coding specification which corresponds to high definition television.

I/O: Input/Output

IP: Internet Protocol

Kbps: 1000 bit per second

LED: Light Emitting Diode

LNB: Low-Noise Block

MAC: Medium Access Control

Main level: A range of allowed picture parameters defined by the MPEG-2 video coding specification with maximum resolution equivalent to ITU-R Recommendation 601.

Main profile: A subset of the syntax of the MPEG-2 video coding specification that is expected to be supported over a large range of applications.

Mbps: 1,000,000 bits per second.

MER: Modulation Error Ratio

MGT: Master Guide Table

MIB: Management Information Base

MP@HL: Main profile at high level.

MP@ML: Main profile at main level.

MPEG: Refers to standards developed by the ISO/IEC JTC1/SC29 WG11, *Moving Picture Experts Group*. MPEG may also refer to the Group.

MPEG-2: Refers to ISO/IEC standards 13818-1 (Systems), 13818-2 (Video), 13818-3 (Audio), 13818-4

MPTS: Multiprogram Transport Stream

NTP: Networking Time Protocol

NTSC: National Television System Committee

OSD: On Screen Display

PAL: Phase-Alternating Line

PAT: Program Association Table

PCM: Pulse-Code Modulation

PCR: Program Clock Reference

PCM: Pulse-code Modulation

PID: Packet Identifier. A unique integer value used to associate elementary streams of a program in a single or multi-program transport stream.

PMT: Program Map Table

Profile: A defined subset of the syntax specified in the MPEG-2 video coding specification

Program specific information (PSI): PSI consists of normative data which is necessary for the demultiplexing of transport streams and the successful regeneration of programs.

Program: A program is a collection of program elements. Program elements may be elementary streams. Program elements need not have any defined time base; those that do have a common time base and are intended for synchronized presentation.

PTS: Presentation Time Stamp

QAM: Quadrature Amplitude Modulation

QPSK: Quadrature Phase-Shift Keying

RDS: Receiver Decoder System

RF: Radio Frequency

RGBHV: Red, Green, Blue, Horizontal, Vertical

RO: Read Only
RPM: Revolutions Per Minute
RRT: Rating Region Table
RS-232: Recommended Standard. A standard for serial binary data interconnection.
RU: Rack Unit
RW: Read/Write
SD: Standard Definition
SDI: Serial Digital Interface
SFP: Small Form-Factor Pluggable
SI: System Information
SMPT: Society of Motion Pictures and Television Engineers
SNMP: Simple Network Management Protocol
SPTS: Single Program Transport Stream
SSRC: Synchronization Source
STD input buffer: A first-in, first-out buffer at the input of a system target decoder for storage of compressed data from elementary streams before decoding.
STD: System Target Decoder. A hypothetical reference model of a decoding process used to describe the semantics of the Digital Television Standard multiplexed bit stream.
STT: System Time Table
TS: Transport Stream
TVCT: Terrestrial Virtual Channel Table
UTC: Coordinated Universal Time
VANC: Vertical Ancillary
VBI: Video Blanking Interval
VCT: Virtual Channel Table. Used in reference to either TVCT or CVCT.
XLR: Cannon “X” series connector, with a Latch, and Rubber around the contacts.
YPbPr: Component Red, Green, Blue

Appendix B – Error and Event List

Error	Description
12V Supply Error	Voltage on 12V rail has exceeded safe operational range.
3.3V Supply Error	Voltage on 3.3V rail has exceeded safe operational range.
5V Supply Error	Voltage on 5V rail has exceeded safe operational range.
AFD Not Present	Auto Conversion is enabled in Video Service configuration but the stream does not contain an AFD code.
ANC/VBI Line Conflict - AFD	The VANC line AFD is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - AMOL	The VANC line AMOL is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - CC	The VANC line CC is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – EN301775	The VANC line EN301775 is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – OP47	The VANC line OP47 is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – RDD11	The VANC line RDD11 is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – SCTE127	The VANC line SCTE127 is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – SMPTE2038	The VANC line SMPTE2038 is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – Source ID	The VANC line Source ID is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – System Timecode	The VANC line Timecode is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - Teletext	The VANC line Teletext is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict – TVG2X	The VANC line TVG2X is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - VII	The VANC line VII is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - VPS	The VANC line VPS is currently set to be embedded on is conflicting with another line of data in the VANC.
ANC/VBI Line Conflict - WSS	The VANC line WSS is currently set to be embedded on is conflicting with another line of data in the VANC.
Audio Not Decoding	Audio is corrupted in incoming stream or format is not supported.

Auto Video Format Error	AG 5800 is unable to determine the native incoming video in order to format output.
BISS Conflicting PIDs	PIDs selected to be descrambled by one BISS key are already assigned to be descrambled by another BISS key.
BISS Service Not Found	Service that BISS key is assigned to descramble is not present in the incoming stream.
Backup Input Active Condition	Primary input is currently in a failed condition and the AG 5800 has failed over to the Backup input.
Bitrate Exceeded Error	Total incoming transport stream bitrate has exceeded 213 Mbps.
CAM Descramble Fail	CAM Module is not descrambling selected PIDs or services.
CAM Not Present	DVB-CI Descrambling is enabled but CAM Module is not installed.
CAM PID Not Found	PID selected to be descrambled by the CAM is not present in the incoming stream.
CAM Service Not Found	Service selected to be descrambled by the CAM is not present in the incoming stream.
CAM Reset – Manual	CAM has been reset by the user.
ES Type Mismatch	Elementary stream type does not match the stream type defined by the user.
FEC Reception Error	Packets in incoming IP stream cannot be repaired with forward error correction.
Genlock Not Present	Genlock reference is enabled but not present.
IP Loss Error	No IP packets have been received by the MPEG/IP card for two seconds.
ISI Not Found	ISI value defined by the user is not found in the incoming multist6888ream signal.
Incompatible Genlock Reference	External genlock reference is not compatible with output video format.
Input Video Unsupported	Native format of incoming video is not a supported video format.
Link Loss Error	Physical IP link is not present on the MPEG/IP card.
Loss of Carrier Lock	Receiver carrier lock source is lost.
Low Level	8VSB/QAM RF Level is below the user settable threshold
Low Mer	8VSB/QAM MER is below the user settable threshold
Multistream Mode Input Mismatch	Multistream Mode is enabled and input signal is not multistream capable or Multistream Mode is disabled and input signal is multistream capable.
No Services Detected	Service Lock service selection mode is enabled but no services are present in the active input transport stream.
PID Filter Overflow Error	Configured PID Filter TS rate is too low.

PID Filter Selection Not Present	Selected Service or PID is not present for inclusion in the output PID filter TS.
RTP Reception Error	Uncorrectable out of order or duplicate packets are present in incoming IP stream.
SCTE35 Heartbeat Timeout	The user settable time limit has been exceeded between SCTE35 messages.
Selected Audio PID Not Present	PID Locked mode is set as service selection mode and audio PID defined by user is not present in the incoming stream.
Selected PCR PID Not Present	PID Locked mode is set as service selection mode and PCR PID defined by user is not present in the incoming stream.
ES Sync Error Condition	One of the in-use elementary streams is not synchronized to the PCR.
Selected SCTE35 PID Not Present	PID Locked mode is set as service selection mode and SCTE35 PID defined by user is not present in the incoming stream.
Selected Video PID Not Present	PID Locked mode is set as service selection mode and video PID defined by user is not present in the incoming stream.
Service Not Found	Service Lock service selection mode is enabled but service defined by user is not present in the incoming stream.
Temperature Error	The AG 5800 has detected the internal temperature is 60 degrees Celsius or above.
Transport Error Indicator	The AG 5800 has detected that the transport stream error indicator is present on the active input.
Transport Stream Not Present	The AG 5800 0 has detected that the transport stream from the active input is no longer present.
TS Sync Loss	Transport stream sync for input component is not detected.
Unicast Receiver Not Found Error	The AG 5800 cannot discover the destination for the unicast IP stream within 10 seconds after the initial ARP is sent.
Unlicensed Modulation	Input stream on active input is either 16APSK or 32APSK and the modulations are no licensed on the AG 5800.
Unlicensed VCM/Multistream	Input stream on the active input contains a multistream signal and the AG 5800 is not licensed for multistream.
Video Not Decoding	The configured service or video PID to be decoded is not being successfully decoded by the AG 5800.

Appendix C – Specifications

AG 5800 – Base Unit

Includes –	Backplane
System –	
Configurations Allows:	Single video decoder with up to one option input.
Rear Panel:	Fixed inputs and outputs with one option input. Option input not field upgradeable.
Remote Operation/Update Interface –	
Type:	Ethernet, 10/100
Rear Panels indicators:	Link, Activity (To openGear™ frame)
Connector:	RJ45 (To openGear™ frame)
Monitor and Control Interfaces –	
Web server GUI:	HTTP via web browsing for control & monitoring
SNMP:	Control & monitoring
Operating Altitudes	0 to 10000 feet
AC Power –	
Operating Voltage:	100-240VAC
PSU Max Power:	350W (Frame)
Power Draw:	Base Unit with no option cards – 20W
	MPEG/IP option card with active input – 6-7W (additional)
	DVB-S/S2 option card with active input 6-7W (additional)
	DVB-T2/C2/ISDB-T option card with active input 5W (additional)
	DVB-S/S2 option card with active input and DVB-CI Module option with 1 CAM Module installed – 10W (additional)
Max Power Draw:	30W
Genlock Interface (AG 58701) Adds –	
Genlock Connector:	75Ω Female BNC (Frame Mounted)
Input Impedance:	10kΩ
Return Loss:	≥20 dB, 0Mhz to 8 MHz
Drive Level:	1.0 Vpp ±10%
Genlock Capability –	HD – Adjustment of pixels and lines. Max number of dependent on video mode. SD – Adjustment of pixels and lines.
Supported Genlock References:	NTSC Black Burst PAL-B/G/I/D/M/N Black Burst 1080i x 1920 @ 25, 29.97 and 30fps 1080p x 1920 @ 23.97, 24, 25, 29.97, 30, 50, 59.94 and 60fps 720p x 1280 @ 50, 59.94 and 60fps

CRD 1900 – Base Unit

Interfaces –	
Card Slots:	1 Slot for Sencore AG Cards
Chassis Management:	Full control through web GUI or SNMP
Physical –	
Chassis Dimensions:	1.75"H x 13.625"W x 5"D
Power Supply:	12VDC, 5.0A

Video Decoding Features

General –	
TS Data Rate:	0.25-200 Mb/s
Video Decoder –	
Video Profiles and Levels:	Base Unit – MPEG-2 HP@HL (SD Only) H.264 Hi422P@4.2 (SD Only) H.264 Constrained BP@4.2 (SD Only) HD 4:2:0 License (AG 58710) Adds – MPEG-2 HP@HL (HD Formats) H.264 up to HP@4.2 (HD Formats) HD 4:2:2 License (AG 58720) Adds – MPEG-2 422P@HL (All Formats) H.264 Hi422P@4.2 (All Formats)
Video Bit Rate:	MPEG-2 1-100Mb/s (dependent on profile) H.264 CABAC Entropy coded 1 - 80Mb/s CAVLC Entropy coded 1 - 100Mb/s
Video Formats:	Base Unit – 1080i x 1920 (16x9) @ 25, 29.97 and 30Hz 1080p x 1920 (16x9) @ 23.97, 24, 25, 29.97 and 30Hz 720p x 1280 (16x9) @ 50, 59.94, and 60Hz 576i x 720 (4x3 or 16x9) @ 25Hz 576i x 704 (4x3 or 16x9) @ 25hz 576i x 544 (4x3 or 16x9) @ 25hz 480i x 720 (4x3 or 16x9) @ 29.97Hz 1080p60 License (AG 58740) Adds – 1080p x 1920 (16x9) @ 50, 59.94 and 60Hz
SDI (Serial Digital Interface) Video Out –	
SDI Standards:	Base Unit – SD-SDI ANSI/SMPTE S259M HD 4:2:0 License (AG 58710) or HD 4:2:2 License (AG 58720) Adds – HD-SDI ANSI/SMPTE 292M 1080p60 License (AG 58740) Adds – 3G-SDI Level A ANSI/SMPTE 424M

Connector:	75Ω Female BNC
Return Loss:	≥15 dB, 5Mhz to 1.5GHz ≥10 dB, 1.5 GHz to 3.0GHz
Drive Level:	800 mVpp ±10%
Data Bit Rate:	3G-SDI – 3.0 Gb/s HD-SDI – 1.5 Gb/s SD-SDI – 270Mb/s
Display Modes:	HD – Pillarbars, Cropped, Anamorphic SD – Letterbox, Cropped, Anamorphic
Digital Video Out – Digital Video Standard:	SDA-HDMI-OM-E Rev A
Connector:	HDMI-type Female Type-A

Audio Decoding Features

Number of Audio Services:	Base Unit – 4 Audio Services 8 Audio Service Decode License (AG 58880) Adds – 4 Audio Services (8 total)
Audio Codecs Supported:	Dolby Digital (AC-3) & Plus (EAC-3) AAC-LC, HE-AAC, & HE-AACv2 MPEG1L2 & MPEG2L2 Linear PCM & Dolby E (Pass-through)
Output Formats:	Digital Pass-through PCM (Decoded Discrete channels for 5.1 Sources or Downmixed for 5.1 Sources)

Audio Output Features

AES Outputs:	2x 75Ω BNC AES3/EBU Unbalanced
SDI Embedded Audio Output:	8 Audio Pairs

Ancillary Data Support

SDI VANC Data Types:	AFD (SMPTE 2016) Closed Captions (CEA-708) OP-47 (SMPTE RDD-08) SMPTE RDD-11 TVG2X, AMOL-48/96 (SCTE-127) Teletext/WSS/VPS (SMPTE-2031) Time Code (SMPTE 12M-2) SMPTE2038 Source ID SCTE104 (SMPTE 2010) VII (SMPTE RP-186)
SDI HANC Data Types: VBI Waveforms (SDI):	Time Code (SMPTE 12M-2) Line 21 Captions (CEA-608) TVG2X, AMOL-48/96 (SCTE-127) Teletext (EN300706) WSS (EN300294) VPS (EN300231))

Timecode in VBI (SMPTE 12M-1)

Video Overlay Support

Closed Caption Overlays:	CEA-608, CEA-708, or SCTE-20
DVB-Subtitle Overlays:	HD/SD with Auto Scaling (EN 300743)

ASI Input and Output Features

General –	
Connector:	2x BNC, Female
Impedance:	75Ω
Return Loss:	≥15dB, 3.5 to 270 MHz
ASI Serial TS Input / Output –	
Number of ASI Inputs:	1
Number of ASI Outputs:	1 (non loop-through)
Standard:	EN50083-9 (V2:3/98) DVB ASI
Data Bit Rate:	270 Mb/s
Maximum TS Rate:	200 Mb/s
Minimum TS Rate:	250 Kb/s
Packet Sizes	Input: 188 and 204 bytes Output: 188 bytes
Modes Supported:	Burst, Byte and Inverted

DVB-CI Descrambling Module Option

CAM Decryption –	
General –	
Compatibility Standard:	DVB-CI EN 50221
Number of CAM Slots:	1
Auto CAM insertion/removal detection:	Yes
CAM Usage:	Selectable, Enable/Disable
CAM Name Display:	Yes
Multicrypt Support:	Yes
Decryption Selection –	
Elementary Stream types:	Video (MPEG2 & H264), Audio
Selection Modes:	Base Unit – Decoded Elementary Streams
Multi-Service Descrambling License (AG 58991) Adds – Individually selectable elementary streams	
Maximum TS bitrate	DVB-CI – 100Mb/s
CAS Supported –	All major CA vendors supported

BISS Descrambling Options

Supported BISS Types:	Base Unit – None BISS 1 – Requires License (AG 58921) BISS 2/BISS-CA – Requires License (AG 58922)
Compatibility Standards:	DVB-CSA1

	DVB-CISSA AES-128 RSA-2048
BISS 1 Modes:	Mode 0 Mode 1 with Session Word Mode E with Session Word and Injected ID
BISS 2 Modes:	Mode 0 Mode 1 with Session Word Mode E with Session Word and Injected ID Mode CA with Public Key and Injected Private Key Mode CA with Public Key and Buried Private Key
Maximum TS bitrate:	200 Mb/s
Number of Stored Keys:	Up to 12 keys
Number of Descrambled Services	No limitation to the number of services descrambled per key

IP Input/Output Option

General –	
Connector:	2x 10/100/1000 auto negotiate Base-T RJ-45 Ethernet Ports
Receive –	
Input Format:	UDP, RTP and RTP with extension headers Multicast and Unicast CBR, VBR, Null Stripped
Receiver Capability:	2 simultaneous MPEG over IP transport streams
FEC Receive:	Pro MPEG CoP3 SMPTE2022 Range: $L \cdot D \leq 100$ $1 \leq L \leq 20$ $4 \leq D \leq 20$ Annex B
Multicast Filtering:	Filters based on IP address
Buffer size:	1 - 4000 KB, or 1 – 4000ms, user configurable
Bitrate Range:	0.25 – 200 Mb/s
Packets/IP Frame:	1-7 MPEG Packets/IP Frame
IGMP Compatibility:	Version 2 and 3
Transmit –	
Output Format:	UDP and RTP
Bitrate Range:	0.25 – 200 Mb/s
Packets/IP Frame:	1-7 MPEG Packets/IP Frame
Number of Outputs:	2 Mirrored TS – Unicast and/or Multicast
IP FEC Output (AG 58925) Adds –	
FEC:	Off, Columns, Columns/Rows
FEC Transmit:	Pro MPEG CoP3 SMPTE2022 Range: $L \cdot D \leq 100$ $1 \leq L \leq 20$

$$4 \leq D \leq 20$$

DVB-S/S2 Input Module Option

General –

Frequency Range:	950 MHz – 2150 MHz
Number of inputs:	2 (A and B)
Connector:	2x BNC, Female
Impedance:	75 Ohms
Return Loss:	≥ 15 dB, 3.5 to 270 MHz
Separation:	>50 dB adjacent, >60 dB non-adjacent
RF frequency:	950 MHz to 2150 MHz in 100 kHz steps
Tuning:	Difference between Satellite frequency and LO frequency
Satellite frequency:	950 – 14500 MHz
LO frequency:	0 – 12000 MHz, with presets of 0, 5150, 9750, 10600, 10750 and 11250 MHz
Packet size:	188 bytes
Tuning Step Size:	125 kHz, maximum
Nyquist root filter roll-off factors:	.05, .10, .15, .20, .25, .35
RF Input Level:	-65 dBm to -25 dBm
AFC Tuning Range:	$\pm .5$ MHz in Standard and Wide mode (with SR ≤ 1 MSps)
	± 1 MHz in Standard and Wide mode (with SR $1 \leq 2$ MSps)
	± 1.5 MHz in Standard and Wide mode (with SR $2 \leq 3$ MSps)
	± 2 MHz in Standard and Wide mode (with SR $3 \leq 4$ MSps)
	± 2.5 MHz in Standard and Wide mode (with SR $4 \leq 5$ MSps)
	± 3 MHz in Standard mode (with SR ≥ 5 MSps)
	± 4 MHz in Wide mode (with SR $5 \leq 6$ MSps)
	± 5 MHz in Wide mode (with SR ≥ 6 MSps)
	Standard / Wide modes user selectable

Input RF Spectrum:	Normal/Inverted Auto Detect
PL Scrambling Codes supported:	0-262,141
Image Rejection:	>30 dB
Noise Figure:	<15 dB, maximum
Max TS Bitrate:	160 Mb/s

DVB-S –

Standard:	EN 300 421
FEC Code:	Conv. + Reed-Solomon
Modulation:	QPSK
Modulation/Coding supported:	CCM

Code rates:	1/2, 2/3, 3/4, 5/6, 7/8

Frequency Range:	42 MHz – 1002 MHz
Number of inputs:	1
Connector:	BNC-Type, Female
Impedance:	75 Ohms
Sensitivity:	-34dBmV to + 40dBmV (A74 Compliant)
Modulation:	QPSK, 16QAM, 32QAM, 64QAM, 128QAM, 256QAM, 1024QAM, 4096QAM
MER:	Range: 0dB to 40dB Accuracy: +/- 2dB Low Limit Flag: User Defined
RF Level:	Range: -34dBmV to +40dBmV Accuracy: +/- 5dBmV Low Limit Flag: User Defined

Appendix D – AG 5800 Audio Explanation

Downmix Audio Setup

There are two primary modes of audio down mix operation for the AG 5800 receiver/decoders. These settings only affect the signal if the digital output is set to PCM. It will also affect those embedded audio channels that are set to a PCM down mix. There are no gain changes or decoding if the digital or embedded outputs are set to Pass-through. The preset modes are Monitor (the default setting) and Transmission.

The first preset, Transmission, allows no changes by the customer. Transmission is intended to provide a limited dynamic range signal to drive a set top box or a transmitter. The Transmission mode does respond to dialog normalization data. It provides a gain boost of 11 dB and has compression to prevent the signal from overdriving a modulator. The 11dB gain boost is applied to the outputs, AES digital outputs set to PCM, and any embedded outputs set to PCM. It will not affect the gain of digital outputs or embedded outputs set to Pass-Through. It is intended to provide a similar audio level as a broadcast TV station signal through an RF modulator. The down mix includes the center and surrounds channels if they are present, and is represented as Lt/Rt. (left total, right total)

The second preset is Monitor. It has moderate processing, no gain boost and its down mix involves left and right channels only (Lo/Ro). The mode setting is Line as the default, but may be changed to RF, Custom 0 or Custom 1. In Line mode, the Dolby Dialog Normalization data is followed along with moderate processing. The default down mix setting for Monitor is Lo/Ro. The down mix may be changed to Lt/Rt or Lt/Rt/auto. Lt/Rt auto follows the embedded data in the stream if the producer has a preferred down mix. It will switch automatically between Lo/Ro and Lt/Rt depending on the data in the stream. If no mode is specified, the down mix will be Lt/Rt. In addition, the Dual Mono modes of operation may be selected. They will only have an effect if the stream is encoded as Dual Mono. Dual Left or Dual Right applies that signal to both left and right channels of the digital service, left and right channels of the outputs, and left and right channels of any embedded stream set to PCM. Selecting RF as the compression setting will add 11 dB of gain and the same processing as the Transmission mode to the outputs, AES digital outputs set to PCM, and any embedded outputs set to PCM.

There is an additional selection at the bottom of the Dolby setup pull-down menu. This allows selection between Professional Mode and Consumer Mode. In Professional Mode the built-in latency value is 32 ms for all formats. In Consumer Mode, this latency varies depending on the format. If you wish to monitor using a consumer receiver, you should choose Consumer Mode. The output sampling rate will always be 48 kHz, even in consumer. The Consumer/Pro identification bit will be set to Consumer. Normal operation in the air chain will use the Professional setting. This setting affects both Dolby Digital (AC-3) and Dolby Digital Plus.

If you want to run with no processing, choose Custom 1, Lo/Ro, and Dynamic Range disabled. This will still allow gain changes called for in the Dolby metadata via Dial-Norm settings in the stream.

Audio Output Settings

The digital audio services may be set to PCM (AES) or Pass-through (AES data) for stereo as an output. This applies to all available sources. The digital audio service may also be set to PCM (AES) for Mono. The PCM setting will decode and automatically down mix an AC-3 or Dolby Digital Plus stream to two channels of AES audio for stereo. Pass-through simply passes thru the Dolby AC-3 data in an AES stream to be decoded by an external decoder such as the Dolby 568. Be aware the Dolby DP-568 is a professional decoder and always has a decoding latency of 32 msec. The older Dolby DP-564 has both professional and consumer modes of operation. If it identifies the Pro/Consumer ID bit as Professional, the latency will always be 32 msec. If it identifies the Pro/Consumer bit as Consumer, the latency will vary according to the format. Check the DP-564 manual for the actual latency values for Consumer mode. The analog channels can be assigned to any of the digital sources. The analog gain may be adjusted for the desired level. The gain setting does not affect the level of either the embedded audio or the digital services. A setting of +4 dBu provides an output of +4 dBu for a digital signal level of -20 dBFS. To check the audio output level, place the audio setup in Custom1 mode, down mix set to Lo/Ro, and the Dynamic Range disabled. This will remove any signal processing in the down mix. Set the digital service output being measured to PCM. A test stream of -20dBFS will output from the digital services as -20dBFS. If the analog channels are set to a gain setting of +4 dBu, the output should be +4 dBu plus or minus 0.5 dBu. The analog output level can be set in increments of 0.5 dBu from -10 dBu to +4 dBu referenced to a -20 dBFS digital input level. When you are setting the output levels it is suggested that an AC-3 stereo tone (2.0) be used as the source. Do not use a Dolby AC-3 5.1 tone source as your test signal. The five channels will down mix to a different level structure than a stereo signal depending on the down mix setting.

Mono Audio

Audio outputs for the embedded SDI audio and Digital AES audio ports have the ability to be configured for Stereo or Mono applications. Mono Audio allows specific decoded audio channels to be independently routed to Channel 1 (left) or Channel 2 (right) audio on the embedded SDI or AES audio outputs. These channels can be configured as the Left Channel and Right Channel mono audio which allows for custom audio configurations to be made with the decoded audio channels. Each left or right audio output channel will carry one specified audio channel from the decoded audio channels. This could be one of the left, right, front, center, surround, or LFE channels. The flexibility of the Mono audio output feature allows the user to map any combination of 2 decoded audio channels together to create a dual mono audio output.

For example, an audio PID with Dolby Digital 5.1 Surround can be discretely decoded. If Audio 1 is setup to discretely decode Lf/Rf and Audio 2 is setup to discretely decode Ls/Rs, the output Mono audio configuration could set the Left Channel to Audio 1 Channel 1, and the Right Channel to Audio 2 Channel 2. In this example, the output would have Lf and Rs paired together as dual mono on the audio output.

Downmix Reference Table

The following table is applicable for MPEG Audio (Mono and Stereo), Dolby Digital (Mono, Stereo and 5.1), Dolby Digital Plus (Mono, Stereo and 5.1) and AAC (Mono, Stereo and 5.1).

Incoming audio PID -->	Downmix Option	--> Output effect
Stereo	Lo/Ro	OUT = IN
Stereo	Lt/Rt (DS)	OUT = IN
Stereo	Lt/Rt (Auto)	OUT = IN
Stereo	Dual mono	OUT = IN
Stereo	Dual left	OUT L = OUT R = IN L
Stereo	Dual right	OUT L = OUT R = IN R
Mono	Lo/Ro	OUT L = OUT R = IN
Mono	Lt/Rt (DS)	OUT L = OUT R = IN
Mono	Lt/Rt (Auto)	OUT L = OUT R = IN
Mono	Dual mono	OUT L = OUT R = IN
Mono	Dual left	OUT L = OUT R = IN
Mono	Dual right	OUT L = OUT R = IN
5.1	Lo/Ro	OUT L = L + C + Ls OUT R = R + C + Rs (per ATSC A52)
5.1	Lt/Rt (DS)	OUT L = L + C – Ls - Rs OUT R = R + C + Ls +Rs (per ATSC A52)
5.1	Lt/Rt (Auto)	Lo/Ro or Lt/Rt depending on Dolby metadata
5.1	Dual mono	OUT L = front left OUT R = front right
5.1	Dual left	OUT L = OUT R = IN Lo
5.1	Dual right	OUT L = OUT R = IN Ro

Appendix E – AG 5800 Discrete Audio Configuration

Audio Setup

Selecting the discrete option differs from downmix in that it simply decodes the selected audio channels rather than downmixing multiple channels into 2 channels. The service selection mode from 3.2.10 must be set to PID lock in order to output 3 pairs of audio (and completely decode a full 5.1 input). Assign the audio PID containing the 5.1 audio service to 3 separate audio components. The example in Figure 54 illustrates this with PID 558.

Configure Service Selection

Settings

Selection Mode: PID Lock

On Backup: Use Primary PIDs

Component	Primary	Primary Type	Backup	Backup Type
PCR	49		0	
Video	49	Auto	0	Auto
Audio 1	52	Auto	0	Auto
Audio 2	52	Auto	0	Auto
Audio 3	52	Auto	0	Auto
Audio 4	0	Auto	0	Auto
Audio 5	0	Auto	0	Auto
Audio 6	0	Auto	0	Auto
Audio 7	0	Auto	0	Auto
Audio 8	0	Auto	0	Auto
SCTE35 1	0		0	
SCTE35 2	0		0	
SCTE35 3	0		0	
SCTE35 4	0		0	

Available Services

Refresh

Service/PID	Bitrate (Mbps)
Service 3	6.476
49 PCR	5.964
49 MPEG-2	5.964
52 Dolby Digital	0.395
53 Dolby Digital	0.117
Service 4	8.899
Service 5	2.143
Service 6	1.187

Apply Cancel

Figure 54: Discrete Configuration Example

Desired discrete channels can then be selected for the assigned audio as illustrated in Figure 55.

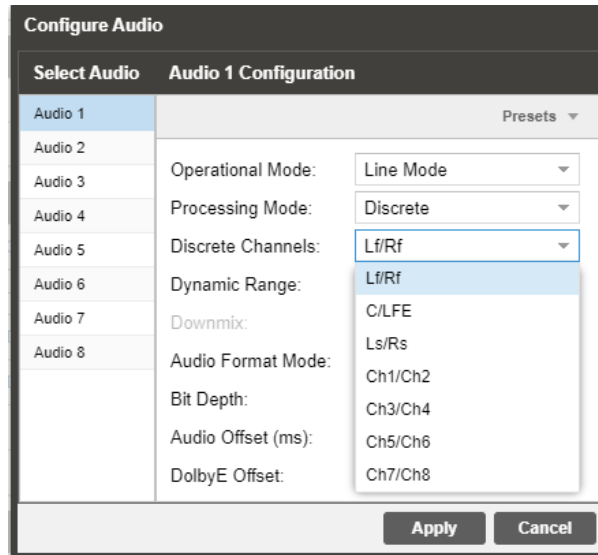

Figure 55: Discrete Configuration Menu

For audio services that indicate the specific channels (Lf, Rf, C, Ls, Rs, LFE) the user can select the audio channels to assign to an output using the named discrete options. If the specific channels are not identified (LPCM Audio for example) than the user can use the multi-channel audio service to select the channel pair of the audio service to output. When the user has selected a named discrete option but the audio channels are not identified in the service the unit will output Ch1/Ch2 (if present) if Lf/Rf is chosen, Ch3/Ch4 (if present) if C/LFE is chosen and Ch5/Ch6 (if present) if Ls/Rs is chosen.

The following audio formats identify specific channels.

Dolby Digital

Dolby Digital Plus

AAC-LC

HE-AAC version 1

Appendix G – CRD 1900 Chassis

Front and Rear Panel Accessibility:

The CRD 1900 chassis has both a front panel and rear panel for accessibility of the AG 5800 card. The front panel may be removed using the screws listed below to access the front edge of the card. Three indicator LEDs on the front panel indicate the unit Identification (**BLUE**), input presence (**GREEN**), and active error (**RED**).

The rear panel allows for input and output accessibility as well as 12VDC to power the chassis and card. The following I/O connections are labeled below.

- 1) Front Panel Screws
- 2) Front Panel Indicator LED's
- 3) 12VDC Input
- 4) Management Port
- 5) MPEG/IP I/O Port
- 6) ASI I/O
- 7) Digital Video Output
- 8) Digital Audio Output
- 9) SDI Output

Default IP Address:

The CRD 1900 chassis will come configured to a static IP address that is accessible through the RJ45 management port. It is configured with the following parameter settings:

Parameter	Setting	Description
IP address	10.0.20.101	This setting is the TCP/IP address assigned to the port.
Subnet Mask address	255.255.0.0	This setting is the subnet mask assigned to the port.
Gateway	10.0.20.1	This setting is the gateway address assigned to the port.

How to Reset to Default IP Address:

If the IP of the unit is unknown the default IP address may be reset. To reset the unit to the default IP, the following steps are provided:

1. Remove the front panel of the CRD 1900 chassis to reveal the AG 5800 card.
2. Power on the CRD 1900 chassis and AG 5800 card, it will take about 3 minutes to fully power on.
 - a. Hold the black button on the card edge until the red LED turns off.
 - i. If the button is held until the blue LED blinks, the card will be sent into recovery mode. The card can be rebooted to revert this process.
 - b. The card is now processing the reboot function, this should take about 5 minutes to complete.
3. Once the card is fully rebooted, the default IP settings are configured.
 - a. Using the management port, the default IP address above will be accessible.

Appendix H – Warranty

Sencore One-Year Warranty

Sencore warrants this instrument against defects from any cause, except acts of God and abusive use, for a period of 1 (one) year from date of purchase. During this warranty period, Sencore will correct any covered defects without charge for parts, labor, or recalibration.

Appendix I – Support and Contact Information

Returning Products for Service or Calibration

The AG 5800 is a delicate piece of equipment and needs to be serviced and repaired by Sencore. Periodically it is necessary to return a product for repair or calibration. In order to expedite this process please carefully read the instructions below.

RMA Number

Before any product can be returned for service or calibration, an RMA number must be obtained. In order to obtain an RMA number, use the following steps:

1. Contact the Sencore service department by going online to www.sencore.com and select Support.
2. Select Service and Repair from the options given.
3. Fill in the following required information:
 - a. First & Last Name
 - b. Company
 - c. Email
 - d. Phone Number
 - e. Ship and Bill to Address
 - f. Unit Model and Serial Numbers
4. An RMA number will be emailed you shortly after completing the form with return instructions.

Shipping the Product

Once an RMA number has been issued, the unit needs to be packaged and shipped back to Sencore. It's best to use the original box and packaging for the product but if this not available, check with the customer service representative for the proper packaging instructions.

Note: DO NOT return any power cables or accessories unless instructed to do so by the customer service representative
